From: John Matthews <jm@vcd.hp.com>
Message-ID: <3ql0d3$j23@news.vcd.hp.com>
Source record: 91227

Sorry if this is an obvious question, I'm new to this group.
I remember as a kid hearing about this great economic
game for the Atari 800 called "M.U.L.E." I never had a chance
to play it, and now I can't seem to locate a copy. It was a
commercial, floppy disk only game. Any ideas? Thanks,

AIX has it as well, and I believe BSD does too. I just spent 2 hours
moving 150 megs of source code to BSD, so I bet whatever I need is in
there. (The entire OS, GCC, CC, etc., it's got to be in there, it better
be in there, grin).

Thanks for the code, it will come in handy.

7. Re: DCM format

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-01 00:00:00 UTC
From: crow@coos.dartmouth.edu
Message-ID: <3qlc4m$f6t@dartvax.dartmouth.edu>
Source record: 91229

I've hacked the code to now compile under gcc with no errors or warnings. To do this, I made the paging stuff #ifdef'd to be DOS-only, since we Unix people can pipe the output to `more` and avoid the messy details. I've also cleaned it up a little bit, changing some sequences of ifs into switches.

I haven't examined the code enough to fix any problems with assumed endianess (byte-ordering) or variable size.

I would like to see an option added to allow for writing ATR output files.

My hacked code is available via FTP from:
ftp://ftp.cs.dartmouth.edu/pub/crow/dcm.c

I would wait to post this, but I don't want to duplicate effort.

8. Atari Modem Cable

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-01 00:00:00 UTC
From: rbmier@winternet.com
Message-ID: <3qldno$i5t@blackice.winternet.com>
Source record: 91230

For all those looking for an Atari Modem Cable for the 850
MIO, P:R:C, BlackBox, I found my old instructions for converting.
You must purchase a standard modem cable with a
DB25M on one end and a DB9M on the other. Also, you must
be able to take the DB9M end apart (Can't be a moulded end).
Take the DB9M end apart and get out the soldering iron.

Remove the wire from pin 4
Move the wire from pin 2 to pin 4
Move the wire from pin 1 to pin 2
Connect the wire already removed from pin 4 to pin 1

Here it is again:

Pin 1 move to Pin 2
Pin 2 move to Pin 4
Pin 4 move to Pin 1

You now have a Atari Modem cable.

Rich Mier

Most devices for the Atari (disk drives, printers, etc) have two
connectors so that you can daisy-chain them together. The 410 would
have to be at the end of the chain, or you could use an adapter like the
"Quintopus" from CSS (see the Atari 8-bit Vendor list posted regularly in
this newsgroup.)

11. High capacity SIO2PC images

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-01 00:00:00 UTC
From: jasond@uranus.kendall.mdcc.edu
Message-ID: <3qlal4$l6f@uranus.kendall.mdcc.edu>
Source record: 91233

I think I narrowed down a more-or-less foolproof way to create a high capacity SpartaDOS disk image under the SIO2PC. Here's how it goes:

1) From DOS, load SIO2PC. Set the port number.
2) Create the image you want right off the bat. I don't remember the exact command sequence, but tell it create double density, custom size, and then input the size you want. Make sure you set it as drive #3, and make sure it is listed in the first slot.

3) Load a SpartaDOS disk image into slot #2, as drive #1.
4) Boot SpartaDOS.
5) Run "HDFORMAT", tell it drive #3, and wait.

Voila! You should have a working SpartaDOS image of the wanted size.

Give this a try + let me know how it works.

Remember that you must exit to DOS and restart SIO2PC any time you want to make a new image.

Chad Wagner (cmwagner@news.gate.net) wrote:
: manufacturer specific functions. I could probably think of 20 functions
: in Borland C that are Borland specific.

Plain and simple. Just dont use them. (grin) As for portability,
try to use only ANSI-C or POSIX.1 standards. I could help out in the
Portability section as I have extensive experience porting software
packages between various platforms. All of my Unix based packages use
GNU's 'autoconf' (AutoConfig), which is a sweet sweet tool. It has enabled
many packages to be run with the simple command of 'configure' followed
by a 'make install'. (Platforms which I have workd on and ported things
to: SunOS 4.1.1, SunOS 4.1.3, HP-UX 8.0.x, HP-UX 9.0.x, AIX 2.2.x, AIX
3.2.5, Linux, SCO Unix, OSF/1, and IBM4.3 (BSD 4.3/AOS)). However,
I'm sure your code doesnt even deal with more than 5% of non-portable
issues.
As for things coredumping, You should always check the value of argc
and if it isnt what you're expecting, then you should print out a little
usage message. This is common practice under Unix.

What exactly does stricmp() do anyways? I've never heard of it, but if
its like strcmp() then use that, as it is ANSI-C and POSIX.1 standard.

On my Linux system, as well as the Ultrix system I'm using right now,
'strcasecmp(3)' is a case-insensitive comparison. Everything gets
translated to lower case. How about changing the 'stricmp' calls to
'strcasecmp', then put this in the header:

```
#ifdef __MSDOS__
# define strcasecmp stricmp
# define strncasecmp strnicmp
#endif /* __MSDOS__ */
```

Anyone have a unix equivalent to kbhit? getch is in ncurses (maybe in
old curses too), but I don't see any reason to bother with (n)curses
for this simple program. Come to think of it, why not just skip the
pager, and pipe it into 'more' when you want to page?

Eh, don't let the nit-pickers discourage you. Programming is an
art. Some people would be shocked by things that Picasso did in creating
his art. :) There's nothing wrong with coding it the way you did. It
got the job done, and that was all you intended it to do. While I will
not be using your code, I am thankful that you posted it so that others
could benefit from it.
And, after all, those who have a problem with the way you coded
can always capture it, load it into their editor, and change whatever they
want to . . . :)

A few people did, and they put there code online for all to see. But since this thread is still going then I should let everyone know that I have a compilable version of dcmtoatr.c (based on dcmana.c) under UNIX and DOS, I just ran it and it worked fine. It is much cleaner than dcmana.c, because I had more time to refine the program, and it is actually near a user usable level. I will include three binaries with the 1.1 release of dcmtoatr.c, AIX 3.2.5 binary, FreeBSD 2.0 binary (should work on any BSD box), and a MS-DOS binary, others will just have to compile the code with gcc, and pray. I will release this code probably to ftp.xmission.com, as long as James is ok with it, and I will try and put it on umich.edu, but for the time being the 1.0 code is in the uploads directory at xmission.

So basically to end my blabbering, they don't have to worry about it because I did it. They just need to be paitent, so I can weed any possibly bugs, and attempt at writing a document explaining the program. I don't know how widespread the use of the atr format is, but if there is Atari emulators under UNIX then I can see there is an absolute need for this program to be compiable under unix.

I've now pulled the byte-ordering code into a separate function,
but I'm not sure if the high byte is supposed to be first or
last.

I've also changed a lot of the fread() calls into fgetc() calls
where it's only reading a single character.

Again, my modified portable version of the DCM converter is
available at:
ftp://ftp.cs.dartmouth.edu/pub/crow/dcm.c

19. Percom drives

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-01 00:00:00 UTC
From: bjcorr@delphi.com
Message-ID: <9506010142593.DLITE.bjcorr@delphi.com>
Source record: 91241

Well, I finally got an old Percom drive (rfd-40) for about $15 (with a slave drive!) from my local used place so I could try out the 720K conversion. I got a used 720K 3.5" drive for $9, took the drive apart and yanked the full height 5.25" mech out, dropped in the 3.5" unit and fired it up!

It works!

The original mech was SSSD (I thought the rfd-40 was DD?), and ran hot as all percoms do. The new unit is DSDD, 80 track, runs cooler and makes me feel a lot safer about the longiviety of my software. And 3.5" is so cool!

If you guys come across any old Percom's, GRAB'EM! The mod is child's play, took 15 minutes (jumper the new mech correctly for the right drive number!)

720K and 3.5" for under $20. Life is good.
bjcorr@delphi.com

20. Re: Something else to bug Mr. King

Newsgroup: comp.sys.atari.8bit

From: followel@ix.netcom.com
Message-ID: <3qjea5$ifb@ixnews4.ix.netcom.com>
Source record: 91242

I would personally like to thank Mr. King for running his site. I have only had trouble with a few of his files and I think that most of you that are having trouble running things on emulators should blame the emulators and not the disk images.
As I said, there are a few defective images. There is one called ADMS5TO9.XFD which has only Scott Adams adventures 5 to 8 (not 5 to 9) on it. Only 5 and 6 will run. If you try to run 7 or 8, the machine locks up, regardless if you're running it on an emulator or a real Atari. If you see this Mr. King, you may want to check into it.
As I said, overall Mr. King's stuff has a pretty good track record and I really appreciate all his work!

Sincerely,
- Byron Followell

Source record: 91106

YAY! YAY! It worked on a multi-part DCM I had..

Now, when're we gonna see an atrtodcm converter?!?

Also, one thing for MSDOS users to note: I tried copying like this:

copy top9502b.? top9502b.dcm

and it came out with a tiny (4k) file

copy top9502b.1+top9502b.2...+top9502b.6 top9502b.dcm

and it also came out with a tiny file

It seems copy seems to think that dcm's are text files, and for some
absolutely RETARDED reason, saves them as such!!!

Be sure to use the "/b" switch when doing a copy of multiple DCMs into one
destination DCM..

now to log off and boot up this new disk image! :)

Ah! So that's what PIO2PC is! (Wouldn't it be PBI2PC, technically?
Actually, wouldn't SIO2PC really be SIO2RS232 or SIO2COM? oh.. anyway)

That sounds cool.. how hard is it to build? How much would it cost?

Sysops who have Atari files online as ATRs would be stupid (sysops with XFDs would be idiots!).

To run an executable "out of the box":

xf25 somedos.atr file.com

It may be nice to have a program unARC into an ATR, but with the suggested DIR2ATR / ATR2DIR programs that I REALLY hope someone makes soon, it could be simply:

```
mkdir temp
arc x blah.arc temp
dir2atr temp blah.atr
```

hell, a nice .batch for this would be: (call it "arc2atr.bat" :))

```
mkdir temp
arc x %1.arc temp
dir2atr temp %1.atr
del temp
rd temp
```

And finally, with TWO (count 'em, TWO) DCM -> ATR conversion utilties, it SHOULD be clear that DCM is the disk image format of choice, no matter if you're on Unix, MSDOS (or, if dcmtoatr compiles on a Mac, a Mac.. 'course, we need an Atari emulator for the Mac.. or at least >I< _want_ one :))

FINALLY, as I said BEFORE, many Atarians just HAVE disk drives, so if they want an ED disk, they'll want the disk image not to be BIGGER than their measly ED drive can handle!

Since SIO2PC and PC Xformer both use ATR, and the couple of PC-based disk image-using utilities use ATR (like S2PC and AtarImg), and of course, since converting DCMs to ATRs is a snap thanks to DCMTODSK, ATR >IS< the most wide-spread disk image format for the Atari next to the ultimate standard, DCM itself!

35. dcmatr11.zip

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-02 00:00:00 UTC
From: cmwagner@news.gate.net
Message-ID: <3qmc2j$19on@seminole.gate.net>
Source record: 91115

I just wanted to let everyone know that DCMTOATR 1.1 distribution archive is
available, it include the source code as well as a MS-DOS executable, you can
get it from:
ftp://ftp.gate.net/pub/users/cmwagner/msdos/atari/dcmatr11.zip

I will be sending it to ftp.xmission.com and atari.archive.umich.edu as
soon as possible. The source code seems to be very portable now. It has
been compiled under MS-DOS 6.22, AIX 3.2.5, FreeBSD 2.0, and Ultrix 4.4. It
is now supporting multi-part 'split' archives, as well as 'big' archives,
and all known block types. If anyone has any problems with this archive,
compiling, or find an archive that has a problem being processed then
please send me the Disk Communicator image through e-mail (uuencode it),
and any error messages encountered during use or compiling of the program
through e-mail, as well.

37. ATR <--> Unix/Dos directory tree

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-02 00:00:00 UTC
From: crow@coos.dartmouth.edu
Message-ID: <3qmetm$k2h@dartvax.dartmouth.edu>
Source record: 91117

```
In the spirit of the 1450XLD, I am pleased to announce these two
"soon-to-be-released" programs:

atr2dir disk.atr [destdir]

Atr2dir reads an ATR format file containing either a MyDOS or
SpartaDos file system, and extracts all the files from the
disk image into separate files on your PC or Unix file system.
In doing this, it will create any needed subdirectories.
Files in the root directory of the ATR disk image are placed
in the current working directory if a destination directory is
not specified.

And of course, the reverse:

dir2atr [-m | -s] [-d] #sectors disk.atr [sourcedir]

Dir2atr creates either a MyDOS (-m) or SpartaDos (-s) ATR disk
image file containing all the files and subdirectories in the
source directory, if specified, or the current working
directory. The disk image contains the specified number of
sectors, which are single density unless the '-d' flag is
specified.

If a Unix filename exceeds the limitations of the Atari
format, it is not included and a warning is displayed.

An error occurs if disk space is exhausted, or if an
insufficient number of sectors is specified to hold the files
in the directory tree.

This would make file manipulations much simpler for those of us using
SIO2PC.

Unfortunately, I don't know the MyDOS or SpartaDos disk formats.
Also, I lack the time to write this myself, so don't expect me to
write it until I've bought a 1450XLD at my local K-Mart. I might be
willing to help if someone else will take charge, though.

I should have mentioned that the key word above is "currently"... keep
on eye on the thread about DCM files. If you can convert ATR and XFD
files to DCM format, you can use discomm to put them on a real disk.

It should be defined in stdio.h, as it is part of the standard
definition of fseek(). I believe that on most systems, this is
defined to be 0, so you could insert the following code:

```
#ifndef SEEK_SET
#define SEEK_SET 0 /* May be missing from stdio.h */
#endif
```

CW> converter, but he felt that this wasn't something that people wanted.

Well, a DSK2DCM may not be needed right away, but one will be needed
eventually, and possibly fairly soon. As more and more of the ATARI 8-BIT
BBSes fade away, I can easily forsee a time when the only source of ATARI
archives on BBS systems will be in the emulator sections of file download
areas. My guess is that these ATARI files will probably be stored in PC
run image format rather than in ATARI "native DOS" format (since PC users
will complain if it can't run "out of the box"). Native 8-bit Atarians
and new users would then be unable to use native Atari code because they
would only be run-format compatible with an IBM PC ! (I can just hear the
IBM Sysops now... "What do you mean you want to run an ATARI program on
an ATARI computer ? 'ATARI' is an IBM PC graphics format.... I thought
that --EVERYONE-- knew that!" ;-<)

49. PIO2PC question

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-02 00:00:00 UTC
From: CONRADUS@PLEARN.EDU.PL
Message-ID: <199506021711.MAA02964@mail.cs.utexas.edu>
Source record: 91252

Hi.

Some (two or three) months ago I have uploaded the PIO2PC files to Merit. (with PIO2PC you can use a PC as a XL/XE hard drive; it uses a parallel connection, so data transfers are relatively fast). My question is: did anyone build it?

Konrad

I thought like I expect most of us did that the great old 8 bit was dead. I imagined that I was the only old guy fiddling about with his 130xe & his 1050 drive. But Im glad to say I was wrong. And boy was I wrong big time.....

For years Ive collected, cared for (bar 1 disk, sniff sniff) and enjoyed the odd game of jumpman, whistlers bros & Star raiders to name but a few.Ive enjoyed the fiddling with the OS via my Omnimon. Never till I started on the Net did I realise the size of the following the Humble 8 bit still has..

Well people You have been a great help so far & If I can offer any help then I will consider that a pleasure..
Keep the side going..

Paul

54. Atari Stuff (reprise)

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-03 00:00:00 UTC
From: cirrhinus@aol.com
Message-ID: <3qprv8$cld@newsbf02.news.aol.com>
Source record: 91126

Hi. Hopefully y'all remember me from about two weeks ago. I'm the one with
boxes of old Atari stuff. I have been having _real_ trouble sending out
individual messages via AOL to all who responded to my first inquiry. In
addition, I attempted to post to this board a week ago and I don't see my
second message so I'll try again. Sigh.

I must (sort of) apologize for taking so long to get back to you. I was
quite surprised to get seven responses inside of 48 hours, and I figured it
might be better to wait a week or so and let all of them trickle in whilst I
attempted to figure out what to do with the stuff.

Like, who should I give it to? Had I realized there was this much interest,
I would have dropped a list of equipment on the board and asked for bids.
But I'm not hurting for money (it's not like this stuff is going to buy me a
Ferarri, after all) and it wouldn't be fair to start asking for money now
after saying that I just wanted postage.

Currently I am leaning towards a measure of geographical proximity. I live
outside of Washington, D.C. If someone lived around here life would be
simpler (no packing and waiting in line at UPS). As it is, one of you lives
in Baltimore which is not only close, but is aksi the home of some of my
relatives, so I go there often.

I will, however, entertain any return mail you care to write up. Humor and
originality are always welcome, though pathos is a good standby. Like, if
you're fixing stuff up to donate to the local orphanage or something. I'll
ignore any monetary offers (though I still want postage if it comes to
that).

In addition, it may be that it makes sense to split up the loot so that
people get the things they are really interested in, as opposed to dumping
the whole pile on one person who only wants a few items. With that in mind,
and to answer those of you who asked, I have constructed the following
list:

dual 5 1/4" floppy disk unit made by Percom
OS/A+ operating system, which I believe came with the
Percom hardware in order to provide enough operating
system to handle the floppies, but all is fuzzy now...
the system seems to include a macro assembler
six or seven boxes of single-sided double-density diskettes
with various games and utilities on them (of dubious
parentage and ownership)
valFORTH programming language, distributed on floppy diskette
as near as I can tell, including all documentation
cassette transfer program for moving programs from cassette
to diskette and running them later
Axlon "RAMSCAN" for debugging Axlon or Atari memory modules
(on diskette)

a box of two (2) Atari joystick controllers (model CX 40-04)
a box of two (2) Atari paddle controllers (model CX 30-04)
a manual for a Symtec Light Pen, which I _think_ I still have
stuffed in a box full of IBM PC stuff (anyone need...never mind!)

Atari 800 Computer owner's guide (not too big) and some other
documentation that I should have given to the person who
bought my Atari 800
Atari Personal Computer System Operating System User's
Manual which seems to be written at a good level for a
programmer trying to do useful stuff
Atari Personal Computer System Hardware Manual (ditto)

Your Atari Computer by Ion Poole (with Martin McNiff &
Steven Cook), published by Osborne/McGraw-Hill in 1982)
Atari Basic by Bob Albrecht, LeRoy Finkel, and Jerald R.
Brown, published by Wiley in 1979

Super Sketch graphic entry pad (moveable arm over fixed pad
area) by Personal Peripherals, Inc. which I remember as
being not terribly accurate but moderately useful,
software for it appears to be on a cartridge

games with boxes and instructions:
- StarQuest Rescue at Rigel (cassette)
- Adventure International Rear Guard (cassette)
- Artsci Gomoku (cassette)
- Avalon Hill Empire of the Over-Mind (cassette) ("Adventure")
- Avalon Hill Conflict 2500
- Avalon Hill Lords of Karma

four Atari Program Exchange (APX) product catalogs from 1982
and 1983

Please note that I don't have an Atari computer right now and I have
no way of knowing whether or not any of the magnetic media are
still any good. I probably will trust y'all for the postage and if the
stuff you get is useless you can keep the money.

So get back to me when you can. I'll tarry another fortnight (at least)
from
procrastination if nothing else (I've been moving this stuff around for
years, y'know?).

Marc M. Adkins
Cirrhinus@AOL.com

55. Program idea.. any takers (programmers)?

Newsgroup: comp.sys.atari.8bit

From: James King <jeking7@delphi.com>
Message-ID: <JO1c94J.jeking7@delphi.com>
Source record: 91127

I've had this idea for a program for quite some time. It exists in the PC world, but sadly, not in the realm of Atari.

I think it'd be quite easy to create, but that's _MY_ opinion.

This is what I'd like to see:

A copy/backup program that sent everything out the R: port to another computer waiting to pick it up (another Atari running the same program in receive mode?)

Something like ORION's HARDBACK, but worked by sending all backed up files out the modem.

I have several Atari's (one in my office) that have modems and it would be nice to back one another up serially like that.

What are the chances of this?

Anybody familiar with LAPLINK 5 for the IBM??

Bill; I've got enough solder fumes in me to last a while & since you use discomm a lot. What are the limits of disk comm. For instance, I have several 720k disks with various set-ups, such as CC65. Now it would take me all of 10 minutes to write a program to do sector copies of these to SIO2PC disk images, although a wild card copy would work just as well. But does discomm support that size??? I can forsee a need for large disks as more people use their clones for storage. There are just certain environments where you would rather have a complete set of programs over a series of individual programs. Like a copilation of CC65, TEDIT, C source code, all on a disk that is updated rather then have to search through a directory of a few dozen programs. Much tidier.

57. Re: Help! MYDOS Error 130 w/SIO2PC

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-03 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <139821@cup.portal.com>
Source record: 91129

Scott: If it's what I think it is, it may be one of the bugs in MyDOS, keep a watch on your sector count at the bottom of the SIO2PC screen. 130 is Non existant device so MyDOS may be changing either the device or requesting an unusual sector. There's a chance SIO2PC is just timing out while it writes to HD or something, but that should give a different error number. Let us know what you find.
Rick

:Configuration command to setup the number of sectors and the other drive
:info.

:The problem I'm having now is that, after only copying roughly 1 disk full of
:files to it, I keep getting an 'Error 130' from MYDOS when I attempt to copy
:more stuff to the drive. I don't know what this error code means, since I don't
:have a copy of the MyDOS docs. I can only guess - is it a disk full error?
:Can anyone offer any hints on what's up?

Well, I did manage to get the manuals, and the errors I'm getting seem to
be timeout and device not found errors. I'm not sure why I'm getting these
- could I have a bad SIO2PC cable? I don't think it's the PC - I've got an
old Epson 386sx with a 65 meg hard drive that I've dedicated to SIO2PC
duties....but I've had the same problems on my Dell Pentium 60.

I've actually managed to get this to work on a moderately large (16384
sector) drive. But I will still occasionally get error 130s or error 160s
when I attempt to copy to them. It got to the point last night, after
successfully filling up about 1/3 of the disk, that ANY attempt to write
more stuff to it resulted in an error 160.

AHHHRRGH! HELP! This stuff is SO cool, but it's getting pretty
frustrating....

Thanks,
Scott
(going mad in Minneapolis)

The Atari will support up to 8 Disk Drives, there is no limit to the amount
of devices you can hook up (as long as they drain no power from the SIO
which many devices do!) You just daisey chain them all together using the
I/O ports on the devices. Unfortunatly, the 410 tape drive has no extra
port for daisy chaining, so it must be hooked up last in the daisy chain,
all other devices must come 'ahead' of it in the chain.
Do all the tape drives suffer from this omission?

Source record: 91133

Ah, Rick.. I had always wondered that, actually.. it's unfortunate that I can't test it since DiskComm and SIO2PC don't talk, but what about folks with hard drives or larger floppies? Anyone willing to test the capabilities of DiskComm? Is the current DiskComm format at all "upgradable"? (Not like asking Bob Puff to do anything about it would do much, I'm sure; he seems to be like that quite a bit.. but all of these other neat programs could support it; SIO2PC with DCM access, PC Xformer with DCM access (no writes in either case, of course, unless they want to bloat to ATR on load and compress to DCM on save.. that seems doable!), the two DCM->ATR utilities, etc.)

I guess if anything, DCM may be as limited as XFD when it comes to disk size, but at least you can save a DCM (whole or split(!)) on a floppy...

The Atari's built-in disk access is extremely limited, which is actually
an advantage- switching your DOS is done by simply booting up a different
disk (although there is at least one DOS-on-ROM and that's just via a
cartridge, vs. a chip inside the drive (like on the Commodores)).

You need an Atari DOS disk... DOSes to get ahold of include:

Atari DOS 2.5 for good compatibility.. JUST in case it doesn't run with:
MyDOS 4.53 DOS of choice for many.. very versatile but compatible, or:
SpartaDOS 3.2 DOS of choice for many as well.. a bit more powerful than
MyDOS and has a built-in command line interface like MSDOS
and Unix, vs. a menu like Atari DOS 2.5 and MyDOS
SpartaDOS X Big Daddy of all DOSes, this is SpartaDOS but better,
although harder to upgrade since it's a ROM cartridge...

All are available, the first three are available via FTP or a local BBS,
that is, if you already CAN boot your Atari so that you can turn the DOS
files into bootable disks! :) Check a vendor.
SDX is available from Fine Tooned Engineering, I believe.

Look at the comp.sys.atari.8bit FAQ part 2 for a list of vendors and
developers. Folks like B&C ComputerVisions, BEST Electronics or FTe
would probably be able to supply you(r friend) with a boot disk for
a minimal charge, I'm sure..

From: kendrick@zippy.sonoma.EDU
Message-ID: <9506030608.AA09328@zippy.sonoma.EDU>
Source record: 91140

Error 130.. hmm.. I seem to remember a "can't talk to device" error or
something, but that's more a 138 :)

Other errors to know:

170 - disk full
169 - directory full (make a subdirectory, only 64 files/dirs. per dir)
136 - end of file
139 - (I think it's 139)... pisser with SIO2PC.. esp. w/ DiskComm..

Now... (and this relates to 139 or whatever it is), when you make an image,
FIRST: Set density/etc. in MyDOS with the O command for that drive
SECOND: Format the drive
THIRD: Write DOS to a disk, preferably it, making sure that you've "O"d
(setup) that disk in the position it will be in.. inotherwords, if
you have a 90K disk for D1: that you always boot with, and you also
want your 16MB disk as D2: whenever you boot that 90K disk, be sure
that you set D2: to be 16MB, then write (OR REWRITE) DOS to D1:..
next time you boot, D2: will be set for 16MB and when you write to it,
you won't unexpectedly get a disk-full or some such error even though
you have 15.1MB of space or something! :)

69. Thunder Child Update/Review

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-03 00:00:00 UTC
From: b.poehland@genie.geis.com
Message-ID: <199506030630.AA160671027@relay1.geis.com>
Source record: 91141

Thunder Child Update

A few weeks ago, upon final debugging of my 256K 600XL (aka "Thunder Child"), I placed the unit into my main system & promised I'd report how it performed.

Two days ago, after several frustrating experiences, I removed Thunder Child from my main system & replaced it with my old standby, "Behemoth" (my 1-meg 800XL). Apparently Thunder Child is unable to endure the rigors of my operating environment for extended periods of time. The difficulties seem to be centered around things that happen when the little 600XL is connected to the Black Box/Floppy Board.

One problem that showed up almost immediately was the BB connector to the PBI port on the 600XL. My BB had a 3M edgecard connector on the ribbon cable. Shame on Bob Puff for using this brand of connector! The metal contacts in these 3M connectors are deeply recessed in the body of the connector, & it turns out the PBI port of the 600XL is several millimeters shorter than the foil fingers on the PBI of the 800XL. So while this connector works fine on the 800XL, it soon *fell off* of the PBI port on the 600XL, just from the vibrations of typing! CRASH! So I was forced to go rooting thru my junkbox collection of connectors until I fished up one whose contacts run the full depth of the connector body. Upon replacing the crummy 3M connector with this better one everything booted up & ran just fine, & the connection remained stable despite my heavy-handed/fist-pounding style of typing.

For short sessions (<1 hour) I experienced no problems at all & began to feel comfortable with the little computer in my usual environment, which in addition to the BB/FB also contains a CSS upgraded XF551 with a slave 720K drive on the SIO, an XEP-80 modified to draw its power from the joystick port, & upon occasion a cartridge stack containing SDX + BXL. (Yeah, I drive my 8bits pretty hard.) In short-session use Thunder Child performed just like any of my upgraded 800XL machines. The Super Video upgrade in this machine gave video performance identical to any of my S-V upgraded 800XLs, & the XLOS ROM in it permitted Thunder Child to run all the software I normally use on my 800XLs, including CopyMate (which crashes in machines containing the stock 600XL OS ROM).

It was during long sessions (>90 minutes duration) that problems began to crop up. The 128K version of AtariWriter-80 began behaving totally screwed-up, mixing part of the Main Menu with the body of my text, throwing extra video characters onto the screen in the Global Format menu, & getting the three 16K text banks all scrambled/jumbled. I also observed junk entries in the Directory of my D8: RAMdisk, accompanied by nonsensically huge byte counts. Shortly after the appearance of these video anomalies, the keyboard locked up in a hard crash that required a cold boot to recover. (On one occasion I lost

100K of e-mail I had just downloaded into the RAMdisk, that was *lots* of fun.)

On the occasions when the machine went into a hard lockup, I observed the bottom of the machine was *really* warm. I'm talking the outside of the plastic case here. Before the exterior bottom case can exhibit an observable temperature increase, any interior heat must first pass thru 3 layers: 1.) the thin cardboard insulator on the bottom of the RF shield; 2.) the metal bottom of the RF shield; & 3.) the outer plastic case itself. The hot bottom was all the more alarming considering that heat usually escapes by *rising* rather than following gravity (!). I can only conclude that it must have been hotter than Hades at the interior of the machine. No doubt the Murphy Demons in there felt right at home.

The bottom heat wasn't evenly distributed; there was a "hot spot". This was centered right smack in the middle of the machine. Motherboard components in that vicinity include the CPU, ANTIC, a bunch of TTL gates, the delay chip, the MMU PAL, & the two 256K DRAM stacks (4 256K DRAMs stacked vertically). In my earlier posts I already reported that the CPU got blazing hot (indeed, several Synertek CPU's failed) after I installed the 256K upgrade. The two DRAM stacks also became quite warm after several hours, *much* warmer than they would be if they were spread out horizontally & individually socketed). The DRAM stacks can't "breathe" at all, & I suspect the chips on the interior of the stacks are getting a good thermal nuking. It doesn't help that the MMU is right next to the DRAM stacks. Like all PAL chips, the MMU also gets blazing hot within the first few minutes of operation. The DRAM stacks get clobbered with waste heat from the MMU partly thru air convection & partly thru direct thermal conduction via the foil traces. The 600XL motherboard itself, being only about 2/3 the size of an 800XL board, is *very* congested, which further compounds the problem of thermal inefficiency. (Forget about adding a fan; there's no room ANYWHERE in there for even a wee tiny one!)

In retrospect, I see another flaw that contributes to the instability of the memory upgrade: total absence of supply bypassing. In virtually all digital circuits the individual chips are provided with a small-value capacitor (typically .1uF), located very close to the chip, to buffer the supply line against supply bus glitches that occur when a digital register changes state. Without these bypass caps, the supply line glitches might cause static logic to change state when no command was issued for it to do so. In the 256K 600XL, the vertical stacking architecture of the memory chips prohibits the installation of bypass caps. The hotter the chips get, the more current they draw ("thermal runaway"). And the more current they draw, the higher the probability of a supply-bus glitch. This, I believe, is probably the mechanism by which this particular upgrade is rendered unstable.

Despite the instability of the upgrade, the machine is still usable. I keep a 2nd 8-bit system dedicated to EPROM burning & disk copying, & Thunder Child is quite happy in that environment, running 5 hours at a stretch with no sign of instability. (I did manage to induce the machine to return errors in data stored in RAMdisk memory after about 15 hours of continuous running of a grueling BASIC program, but this failure was far milder than the failures that occurred with the BB/FB & XEP80 attached, & the machine ran much

cooler.) It would seem that the BB loads down the signal bus on the PBI, forcing the chips feeding the PBI to source more current & run hotter. This apparently is a fairly common problem in XE machines. Bob Puff once told me he was obliged to replace "weak chips" in XE machines that ran fine on their own but failed when the owner attached a Black Box. Unfortunately he didn't say what the "weak chips" were. (Rats!)

There are lessons to be learned here. Foremost of which is that no upgrade should be released to the community unless it has been THOROUGHLY tested. There is just no substitute for rigor! Jeff Popp's 256K 600XL RAM upgrade (which is marketed by Best Electronics), looks great on paper but is not completely reliable due to the manner in which it is implemented. In addition, the written instructions are a catastrophe: the average weekend solder-jockey stands no chance whatever of doing it successfully.

Is it even possible to reliably upgrade a 600XL to 256K? I think so. But, clearly the original hardware architecture must be maintained. This means that a 256K upgrade implemented with 44256 DRAMs (instead of stacked 41256's) should be completely stable, since that hardware permits adequate supply bypassing & the single-chip DRAMs won't be subject to debilitating thermal buildup. The stock 600XL came as a 16K machine utilizing 4416 DRAMs. People commonly upgrade these to 64K, using 4464 chips. This 64K upgrade is simple, cheap, & completely reliable, as it requires only minor changes in the original topology of the circuit. Given that Popp's 41256 upgrade is *almost* stable despite gross violations of the original circuit layout, my experience suggests a 256K upgrade employing 44256K DRAMs should be just as reliable as the 64K upgrade that uses 4464's. Will I be the one to do it? Nope. I've already had my fling at this & spent far more time on it than I ever intended.

My apologies for the length of this post....

- Ben Poehland
The 8-Bit Alchemist

PS-- No one correctly guessed the origin of the name "Thunder Child". I guess we don't have any aficionados of Classic Science Fiction in this group? No H.G. Wells phreaks out there? (That was a hint!)

The next thing on my project list, see if I can get the PC to read these
3.5" disks and vice versa.
HSC has some of the most useful things come through! Just got a Commodore
1702 for $40, they still have 1010 tape decks for $5 each. And a whole lot
of Commodore equiupment (not enough Atari stuff damn it! Guess people
throw away more Commodore stuff <g>. Now I'm trying to find a way to do
1.44meg drives in the Percom. According to Bob, 1.44 can run in the 1050's
using the 8" drive parameters (Rick says he tried this to no avail)
Hmmmm.....
The problemn with 1.44 in the percom is that 1.44 drives need a doubled
clock speed (16MHz) over the 720k units. So you need to supply the clock
and provide a means to swithch the 2 speeds (16MHz and 8MHz).
We'll see. I'm gonna try again to beg some time from Bob for the answers (
and the answers to some IDE questions).
Stay tuned....

Well I'm pretty sure I have the source code to my IBM<=>stock 1050 tranfer program around here (somewhere??). I'm about 50% sure I can find a MicroIllustrator compression/decompression USR(). Seems like the thing to do is just start slugging out some Action! code. MicroIllustrator uses 16 bit RLE type coding so it should be a few % better then diskcomm. I've also got some old DDJ RLE C code that claims to be the best RLE method, but I don't think I want to fool with it. Shouldn't be anything more to it then SIOV & the RLE stuff. I'll pass you a copy when I get it done, you have a high tolerance for non-user friendly software right<g>?
Rick

From: mathniss@link.xs4all.nl
Message-ID: <3qt7r5$jrj@link.xs4all.nl>
Source record: 91152

Howdy folks

My Sony 3.5" 720kB drive that once came with my Deluxe 3.5" XF Upgrade by CSS is starting to act up. Seems like the floppy will not drop down deep enough into the mechanisme for the head to read any data. Today I started to get READ errors. Pushing against the floppy or taking it out and putting it back in (sometime 2-3 times) will make the head read again.

Should I junk the drive and buy a new one? (can't really miss the money right now, too many other things on my list)
Or can I fix this thingy up with a little maintenance?

CU Mathy Van Nisselroy mathniss@link.xs4all.nl

PS taking the drive apart wouldn't be a problem for me, don't know how the drive mech itself thinks about this....

Howdy James

Yep, it'll break off the message, but... If it's very long, like say the FAQ,
it can not find the start of the next message. Happened again with this
package. It contains 316 messages. The FAQ is in msg 39. So I have to
find the starting sector(halve)s of each msg from 40 to 315 (PabQWK starts
counting at msg zero) and then run NDXMAKER.BAS (wrote it myself, just for
this purpose) to get a correct *.NDX file.

J >with me.
J >
J >Rest assurred, several features will be added once I get PabQwk.

I like the sound of that. I'll try and put together a msg, containing some
things I've learned while trying to get around the problems I'm having with it.

One thing I know from the top of my head is, that if you want to send a msg
to somebody that has a longer address then will fit in the header, you can
leave the "To:" open, and put "To:" at the top of the BODY of the msg.
(found that out today).

Let me give an example;

If the name is to long, this would be the header;

Conf: 0 (comp.sys.ata)
To:
Subj: Address too long

Body of the text

To: This.Is@a.name.that.would.not.fit.in.the.header

(start of text)

Howdy Ben

Maybe I'm wrong (I'm not a hardware dude ye' know), but could the following
be true????

The standard only has 16kByte, so it has to do some things differently then
a 64kByte machine. (High memory is lower on a 600XL than it is on an 800XL)
I guess (read: I'm guessing this whole msg together) the 600XL uses memory
differently.

Could this result in the errors you're getting???
Suddenly there is something (read: memory) where nothing used to be.

I hope I got my msg accross, as I'm not very good at this.

k >4MBs and a PS inside...
k >
k >Think that'd help more? (Giving it all more space)
k >
k >-bill!

Howdy Bill

YES! This is my chance to ask the question that's been bothering me for quite
a while now.

I'm using a minitower to:

- power my BlackBox-FloppyBoard combo
- hold two drive mechs (one 5.25 out of a XF551 which had the bad-connectors-
syndrom, and my 1.44meg drive)
- hiding some Atari Power supplies

The big question is:

Do I really need to have the fan running all the time?

I don't like the sound. And in the winter, when my room gets a bit cold in the
evening (the guy that installed the central heating system probably didn't
know that the heating element should have been placed UNDER the windows, not
BETWEEN them, to work properly), the fan circulates the cold air. Making it
even colder. Damn.

Should I buy one of these heat-sensitive "fan sound/speed" dampeners or can
I just unplug the fan (install a switch)

>Do all the tape drives suffer from this omission?

All the various incarnations of the 410 do, but the XL-styled 101 has
a second SIO connection. I never had one, but I've heard that it can
mess up communication to things connected to it; I think because of a
buffer it has.

It can still be hooked to the PBI. Atleast that'S what Atreju (Erhard Puetz)
of IAN and USF-net fame tells me. With a little hardware that is.

There was a whole story about speeding up the XEP-80 on both IAN and USF-net.
Somebody put it up here too I think. The XEP-80 seems to have a 6551 which
will go up to 19.200 baud (and even a bit faster). Atreju even rewrote the
XEP-80 handler for BobTerm so it'll do 9.600 baud (the handler for the XEP80
that comes with BobTerm).

This might be a stupid remark, but have you changed CPU's. There seem to be
a whole bunch of CPU (especially in XE's and especially those CPU's produced
in Mexico) that can NOT take much of a load.

I've found the source of the problem! See below...

bruck@brachot.jct.ac.il (iT) writes:

>Hmm.. if there's an AAAAAAAAAAAAAAAAAA end to a file,
>it will load at the address 65+256*65 but will change *one* byte to A.
>This will happen a few times until the EOF (if the amount of A's isn't
>a multiple of 5 it might Error-136-EOF)..

>So, there might be a DOS error (bad address change)
>Thee might be a crash (a byte changes in the program data)
>Or it might run perfectly! !? !?? ??!?!?!?

That's exactly right. Odds are that you'll be lucky and changing the
one byte won't kill you.

But why am I finding the garbage in the first place?

I believe that it's due to the block padding on the last block when
using XMODEM binary file transfers.

I hope to get around to modifying my program so that it will fix
broken load files, but the curent version is available at:
ftp://ftp.cs.dartmouth.edu/pub/crow/Atari/binload.c

102. Re: ATR <--> Unix/Dos directory tree

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-04 00:00:00 UTC
From: crow@coos.dartmouth.edu
Message-ID: <3qtbkd$imd@dartvax.dartmouth.edu>
Source record: 91174

In a fit of procrastination, I actually got a start on the coding...

crow@coos.dartmouth.edu (Preston F. Crow) writes:

> atr2dir disk.atr [destdir]

> Atr2dir reads an ATR format file containing either a MyDOS or
> SpartaDos file system, and extracts all the files from the
> disk image into separate files on your PC or Unix file system.
> In doing this, it will create any needed subdirectories.
> Files in the root directory of the ATR disk image are placed
> in the current working directory if a destination directory is
> not specified.

ftp://ftp.cs.dartmouth.edu/pub/crow/Atari/atr2unix.c

This is as above, but doesn't support SpartDos format images, and only
runs under Unix, though it shouldn't be too hard to port it to DOS.
About the only thing that shouldn't port is the calls for making
locked files in the disk image read-only under Unix.

In writing this, I found an interesting detail about the .ATR format:
Double density disk image files only use 128 bytes for the first 3
sectors, so my seek calculations are more complicated than I thought
they would need to be.

Also, I found that at least under MyDOS, a directory (including the
root directory at sector 361) consists of 8 sectors where the file
information is stored in the lower 128 bytes with the upper 128 bytes
left as zero. This seems silly, but I suppose it made some part of it
easier for them to code. I am assuming that this is the standard
Atari way of dealing with the directory on double-density disks.

>And of course, the reverse:

> dir2atr [-m | -s] [-d] #sectors disk.atr [sourcedir]

> Dir2atr creates either a MyDOS (-m) or SpartaDos (-s) ATR disk
> image file containing all the files and subdirectories in the
> source directory, if specified, or the current working
> directory. The disk image contains the specified number of
> sectors, which are single density unless the '-d' flag is
> specified.

> If a Unix filename exceeds the limitations of the Atari
> format, it is not included and a warning is displayed.

> An error occurs if disk space is exhausted, or if an
> insufficient number of sectors is specified to hold the files
> in the directory tree.

No, I haven't touched this part. This will be more complicated for
several reasons. First, the ATR->Unix program doesn't have to look at
the bitmaps, whereas this would have to set them. Second, the boot
sectors would have to be recreated in some intelligent manner, taking
into account that they are used to hold information about the disk
format, as well as boot information that is sensitive to the existence
and location of DOS.SYS.

106. Repair for an XEP80 possible?

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-05 00:00:00 UTC
From: mbates@netcom.com
Message-ID: <mbatesD9oMDo.20u@netcom.com>
Source record: 91178

I got an XEP80 used from someone who explicitly told me it WAS broken.
Being the over confident ya-hoo that I am I said I could fix it.

Obviously, you are reading proof that I could not! :-)

Can anyone help? It gets power and all. It even puts a little white
square up in the corner on the monitor. The driver seems to load but I
can not get ANYTHING on the screen.

A) Can anyone help
B) Does somebody fix these for a reasonable price (i.e. lower than the
$40 I can buy one new for)
C) SHould I just junk it and buy a new one?

Thanks
-Marlin

I fail to see why this is needed. It eiither works or it doesn't.

And why not simply add this code to the program itself?

And if you did add a small check it shouldn't be more than a couple
hundred bytes anyway - so what?

>and it didn't know what SEEK_SET and SEEK_END were. I was of course able
>to fix SEEK_SET since I was told it's simply defined as 0, but what is
>SEEK_END defined as??

It's supposed to be in <stdio.h>, but some older systems don't have it:

```
/* fseek() values */
#define SEEK_SET 0
#define SEEK_CUR 1
#define SEEK_END 2
```

I'll put in a check and take care of it for future versions.

crow@coos.dartmouth.edu (Preston F. Crow) writes:

>I hope to get around to modifying my program so that it will fix
>broken load files, but the curent version is available at:
> ftp://ftp.cs.dartmouth.edu/pub/crow/Atari/binload.c

Ok, the version there now will create a new file after cleaing up all
the garbage. Specifically, it:

* removes secondary FFFF headers appearing before load blocks other
than the first one in the file (I found real cases of this).
* discards any load block loading only a single byte into an address
where the high and low bytes are the same, along with any
remaining data in the file (Usually indicitive of XMODEM padding
data).
* moves the run address, if found, to the end of the file.

It also displays each init address, the ranges of each load block, and
the run address, as well as mentioning any oddities found.

Now to go along with this, it would be nice for someone to write an
Atari binary program that uses an init routine which pops off the
return address and displays it on the screen. This could be used to
get an idea of whether or not a program will be able to load.

Well how serious are you? I just picked up my second copy of 6502 assembly language subroutines for $2.50. If you're about $4.50 serious that would cover shipping. *OR* if you would be willing to promise to do something like type in most of the subroutines in the book & upload them to the archive so we'd all have a source of debugged code I could go about $2.50 lower. Understand that typing in these things would be no small task. This is far and away my favorite 6502 title. It assumes you know a little about programming, but the source code is fully documented.
Rick

Mathy; I think what the person was trying to communicate about the
Black Box/MIO is they have a tendancy to use the entire hardware page
rather then the PBI device numbers. For instance, if a BB uses hardware
pages $D100-$D1FF, $D600-$D6FF, $D&00-$D7FF, it doesn't matter how many
PBI devices the thing uses, it's already taken every bit of free hardware
address space so you can't add another device. Well, you could, but it would
have to plug in between the computer & the Black Box & do the decoding.
It's certainly not imposible, but considering the documentation available
it is difficult at best. I waste address space myself, but for some stuff
like a 6551 you only need 4 memory locations. I *think* the BB uses all
768 free hardware addresses which does seem like a lot. Anybody know
different???

"mini-8 to D-25 cable that comes with every modem package for the Mac"

Could you be a bit more specific ? I have always thought about connecting
up a surplus MAC 512K to trade pixel maps back and forth between a MAC
and an ATARI 8-bit. (Also it would be nice to send Daisy-Dot stuff over
to a MAC for printing.) Unfortunately, all of the Macintosh user guides
from the MAC 512K era vehemently deny that the machine is a computer, and
says things like, "Don't worry your little head about all of those technical
thingies, but run to your nearest Apple authorized dealer if you have a
problem." As a point of information, what constitutes a "modem package" ?
Is it necessary to buy a modem before you can get a modem cable ? The
regular mini-8 to D-25 cable I can pick up at my local computer outlet does
not appear to work with any MAC 512K I have encountered. The modem seems
to short out to ground and cause the machine to reboot/reset. :-(Any
technical info on MAC modem cabling to an ATARI would be greatly
appreciated! Thanks

>Anyway was there ever a game that worked with this controller? It does not
>work with the ATARI Poll Position cartridge. I have to use a normal joy stick.
>Could I re-wire it to work like a joy stick. Right now when I turn the knob,
>the car speeds up or slows down.

I don't know any specifics about interfacing with the steering controllers but
I can tell you that the difference between the Steering controllers and Paddles
was that the knob on the paddles can turn only so far in either direction while
on the steering controllers they can turn and turn and turn.
To understand why this is important you need to consider a complete plan view
of a track on the screen. If you are driving a car around then you'll need
to be turning largely in one direction and a paddle would be insufficient for
this.

I believe that a pair of steering controllers only came with the Atari 2600
game Indy 500. I haven't seen any copies of this around for years and it used
to be one of my favourites. The only problem is the controllers, when damaged,
are hard to replace.

```
#==========b.poehland@genie.geis.com, 6/2/95==========
#
# Is it even possible to reliably upgrade a 600XL to 256K? I
#think so.
#But, clearly the original hardware architecture must be maintained. This
#means that a 256K upgrade implemented with 44256 DRAMs (instead
#of stacked
#41256's) should be completely stable, since that hardware
#permits adequate
#supply bypassing & the single-chip DRAMs won't be subject to debilitating
#thermal buildup. The stock 600XL came as a 16K machine
#utilizing 4416 DRAMs.
#People commonly upgrade these to 64K, using 4464 chips. This
#64K upgrade is
#simple, cheap, & completely reliable, as it requires only minor
#changes in
#the original topology of the circuit. Given that Popp's 41256 upgrade is
# *almost* stable despite gross violations of the original
#circuit layout, my
#experience suggests a 256K upgrade employing 44256K DRAMs should
#be just as
#reliable as the 64K upgrade that uses 4464's. Will I be the one
#to do it?
#Nope. I've already had my fling at this & spent far more time
#on it than I
#ever intended.

I think that it should be possible. I have a 600XL with a 256K upgrade
that was designed by a friend of mine here at Bell Labs many years ago.
It uses a custon PAL that we burned ourselves. The trouble is that we
were only able to access 192K of the 256K because he couldn't figure out
how to get enough bit lines for 256K access. That kind of design isn't
my field, so I was no help.

However, the machine runs great and has been operated for hours at a time
with no ill effect. I'm pretty sure he has bypass caps in his design.

#==========J.J. Evers, 6/4/95==========
#
#I just got the program Xf25.zip (Ibm, Atari emulator), But i can't seem
#to figure out how to create "Disk Images". I hope there is a way because
#I've watched the "DEMOS.XFD" files over and over again!

A couple of comments:

1) The documentation tells you how to run other files. I includes
some BASIC files as I remember. You need to do something like
XF25 dos.xfd file.bas.

2) Be sure to get the latest version. XF252.ZIP is available.

3) You can get some .XFD files from James King's ftp location.

Hope this helps.

The pbmplus utilities (which you must have, reading the above) includes giftoppm and ppmtorgb3. You'd then have to convert from 8 bits/pixel to four (for GR.9) by right shifting four times per pixel. Then pack two four bit pixels into one eight bit word for digestion by your Atari.

For a good fast GIF decode routine in C, look out for Patrick J. Naughton's gif2ras.c, or the modifications in John Bradley's xv (both available in source form at finer graphics archive sites near you).

>I fail to see why this is needed. It eiither works or it doesn't.

Yes, but if someone figures out why it doesn't work on some machines,
and then the program would tell people, then they can fix the problem
(use the translator, remove BASIC, use their other Atari), instead of
assuming that the file is corrupt.

One thing I really would like to see is a "program" that pops off the
return address to see where the load routine is in memory to check for
load conflicts.

>And why not simply add this code to the program itself?

>And if you did add a small check it shouldn't be more than a couple
>hundred bytes anyway - so what?

That's exactly what I would like to do--prepend the file with an init
routine that checks for the known incompatibility. In the cases of
multiple incompatibilities, use multiple init routines. All that's
needed is a library of these init routines, and then when someone
figures out that a program has a certain incompatibility, the
appropriate routine can be prepended.

|> which many devices do!) You just daisey chain them all together using the

While working on the "Maze of Agdagon"/GameLink II I discovered there is a limit of the number of devices you can hook up to the SIO bus. I could reliably tie two Ataris (serial ins and serial outs), only sometimes get three to work, but never got four to work. Since we were tying both serial ins *and* outs together, one Atari acts like two devices on the SIO bus. So six or seven devices is about your limit (including your CPU), assuming every device loads the serial in/out lines the same (something I can't check, without schematics to every peripheral).

It had to do with the pullup resistors that the serial ins and outs had (1K ohms to +5V). Pokey didn't have enough drive (sink a logic zero close to ground) after too many inputs are tied in parallel. Removing some of these pullups (risky), buffering the lines with good TTL drivers (messy), or using CSS' SIO extender device would be ways of expanding beyond six or seven devices.

Now I know somebody out there will write back with his anecdotes about eight disks, four printers, and a couple 850s that all work well on one unmodified SIO chain. I did check this out with a scope, and created "artificial" loads to my 8-bit SIO bus, and observed it (to the best of my recollection).

I'm looking to get a monitor for my 800XL so I don't have to tie up the TV set all day. It's been a while since I've used a monitor on an 8-bit, and I don't have any manuals - what exactly do I need in the way of a monitor and cables? And where's the best place to find them? Thanks in advance...

Source record: 91203

A few weeks ago someone graciously posted instructions on how to open up a 600XL and up the RAM to 64K (he even offered to sell me the chips). Well, I lost the post and it's not on my NNTP host anymore - could this person please email me again with instructions, and if the chips are still available, I'm interested! Alternately, does anyone else know how to take this beast up to 64K (or beyond)?

Go for a Commodore 1084 monitor or a 1702 monitor, esp. if you ever want
to do nice looking 80 columns ala an XEP80, IceT or FlickerTerm.

As for a cable, they're not hard to get... just 5-pin din to 2-or-4 RCA
style plugs (either Audio/Video or Audio/Video/Chroma/Luma)

I got a used (but not all the way working) 1084 for about $25 used..

Hello

>Ah! So that's what PIO2PC is! (Wouldn't it be PBI2PC, technically?
>Actually, wouldn't SIO2PC really be SIO2RS232 or SIO2COM? oh.. anyway)

Perhaps :)

>That sounds cool.. how hard is it to build? How much would it cost?

The only problem with PIO2PC is, that it must be the _only_ (so called)
"new device" in your system, otherwise a conflict will happen; but therefore
it was possible to simplify the device, so I think it is easy to build :)

"How would it cost..." I don't know, Bill... :) I don't know US-prices.

I had a better motivator: the TV output sucked. Not only that, but on the TV, the entire display was shifted to the left. The result was that the first couple of columns on the left were not visible on the screen.

>The 800XL has a Super VHS style output. Though back then it was called
>Luma/Chroma. I think it is the same as modern ones, the 800XL being a
>5-pin DIN jack. One pin is composite color, one is strait luminance, one

>hook my 800XL up to my composite monitor.) If you want L/C output on an
>800XL that doesnt have a chroma output, wire the composite color to the
>chroma input and it will work almost as well.

You might find a cable by looking around at electronics stores, particularly one which sells "junk." I picked up a Commodore monitor a few months ago, and found a cable the next day. The cable was not exactly the right one, and it was hacked up and damaged, but it worked and only cost me 50 cents.

I could actually make the cable work even *better*--the one I have only has two output jacks, one for audio and one for standard video--but I'm too lazy...

>As for what kind of monitor to use, you will need an older style composite
>(B&W or color) like used with the Apple 2, C-64, etc. Since these
>monitors are hard to find, it may just be better to buy another TV...

The old Commodore composite monitors, particularly the ones used for the C-64, should work.

:loaded and see if that helps.

:Also, try using the sio2pc cable by itself with no other devices, something
:may be going online when it should not. I have an Indus GT that does
:that occasionally.

Well, it ran fine for me under Windows 95. I get the same errors in standalone mode on my old Epson 386sx that I do under Windows 95 on my Dell Pentium 60, though.

I currently have the SIO2PC at the end of my daisy chain - the 800, two Atari 1050s, and then the SIO2PC. One of the 1050s is drive 1 in my normal setup, and this is turned off. The second 1050 is drive two, and I keep this turned on so I can copy stuff off disk. I've got the ATARI.ATR MyDOS disk loaded on SIO2PC as drive 1, and my large partition as drive 3.

I'll yank the other drives off the machine entirely and try going directly to the SIO2PC to see if it makes any difference. Hopefully, I can get it to work with at least ONE of the drives attached, or else I'm going to have a hell of a time copying files over....

Thanks for the responses thus far....

143. ST Xformer 3.0 with source code

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-06 00:00:00 UTC
From: brasoft@coho.halcyon.com
Message-ID: <3r2e6a$fiv@news1.halcyon.com>
Source record: 91067

LONG MESSAGE!

With the increasing use of my PC Xformer 2.52 and 3.0 emulators of late, there seems to be a corresponding increase in the number of questions I get and postings I see in comp.sys.atari.8bit from people asking about ST Xformer and other Atari 8-bit emulators. ST Xformer was a shareware Atari 8-bit emulator I developed back in 1986 through 1989 and have since made public domain. Although I released the source code to ST Xformer several times (once in 1987 in ST LOG magazine and again in 1989 via online services) it seems that most people are unaware of the fact the source code has been available for 8 years (including a "how to write an 8-bit emulator" article that I wrote in ST LOG). As such, a number of budding emulator writers have been re-inventing the wheel trying to write their own emulators and failing or producing miserably slow versions that are just unusable.

Also, quite a number of people have been asking about a version of ST Xformer for the 68030 to use on TTs and Falcon. The story on that is this: back in 1991 I had a TT and I did make modifications to ST Xformer that allowed it to run on the TT. However, the ST Xformer consists of mostly highly optimized 68000 code which isn't very well optimized for the 68030 (when you optimize for one you "unoptimize" for the other) and so the actual execution speed of "TT Xformer" on a TT was no better than regular ST Xformer on a 16 Mhz ST - roughly the normal speed of an Atari 800. As such I abandoned that idea. Since then quite a number more TTs and now the Falcons have been sold, and there is increasing interest to port ST Xformer to the 68030, which in turn would also permit someone to easily port it to the Macintosh. There is one idiot running around right now claiming to be developing an 8-bit emulator for the Mac, but after exchanging some email with the guy it's clear that he has no clue what he's doing.

Now, I have no plans to buy a TT or Falcon again to develop a 68030 based Xformer, and my Mac at home is only 68020 based. I also don't like to see people re-inventing the wheel, botching it, and giving emulators a bad name as a result. PC Xformer 3.0 is proof that not only can you write a basic 6502 emulator (as many people have done) but you can also make it emulate the complex graphics hardware of an Atari 130XE and display those graphics in real time.

So it is perfectly plausible to write an Atari 130XE emulator for a TT or Falcon or Macintosh and have it run Atari 130XE programs at full speed with graphics support. ST Xformer does about 70% of the work (remember, it's 6 to 9 year old code!) and someone needs to do the remaining 30% to add 68030 support and improve the video support.

I also want to see some common disk format being used by all these emulators. Right now there seem to be 3 formats in use: the XFD format used by ST Xformer and PC Xformer, the ATR format used by PC Xformer and the SIO2PC cable, and the DCM format used by 8-bit BBSs. If possible I would like to standardize on one of these formats and have it be used by everybody - real 8-bit users, ST/TT/Falcon Xformer users, PC Xformer users, Mac Xformer users, and whatever else comes along. I don't want to see more and more emulators pop up, each trying to use a different disk format. That doesn't help anybody. The Atari market is small, the Atari emulator market is even smaller, and if everybody could settle on a common method of transferring files it would help everybody, including my users of PC Xformer. Yes, I have selfish reasons. <grin>

So here is what I have decided to do. I will re-release the ST Xformer source code this weekend. It is ST Xformer 3.0 source code, which is almost identical to ST Xformer 2.55 source code released in 1989 except that it has bug fixes to some common bugs (such as the "font doesn't look right the first time you boot" bug).

All you budding emulators writers out there are free to take the code and port it to a TT or Falcon or Mac or any other 680x0 based machine. Use me as a reference. I will answer any questions you might have about the code, help you get around the 68030 problem, help you understand the workings of the Xformer Cable should you plan to support that, and any other such question. The only catches are: I will not write any code for you, I will not supply you with any PC Xformer code (sorry), and anything you develop and release to the public CAN'T BE CRAP!

If you are such a budding emulator writer, send me email at brasoft@halcyon.com and we'll talk some more. Everyone else, you can download a copy of ST Xformer 3.0 and source code from the Branch Always Software web page at http://www.halcyon.com/brasoft/. Again, I will post it in a few days so it may not be up when you read this.

sloopy.

146. Re: Xf25.ZIP (HELP!!!)

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-06 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3r0it2$8p@nic-nac.CSU.net>
Source record: 91070

The easiest way to make a new disk image is, for example:

In MSDOS:
COPY DEMOS.XFD BLANK.XFD
XFORMER DOS25.XFD BLANK.XFD
In Atari DOS:
I (format)
2 (drive 2)
Y (yes)
Quit back to MSDOS..
COPY BLANK.XFD filename.XFD

Now you have a blank disk supply (BLANK.XFD) and a blank disk (whatever you put in for filename.XFD) to put stuff onto. Every time you need more blank disks, simpyl copy BLANK.XFD into a new file... Easy!

To get files onto it (say, ones you FTPed or downloaded from a BBS):

XFORMER DOS25.XFD filename.XFD filename.ext

Where DOS25.XFD is your boot disk, filename.XFD is the disk image you want to put the new file(s) and filename.ext is the new file (list).

Example, say I got a new game called "GAME" (how original). It's in an ARC and within that ARC there's the program ("GAME.COM"), the docs ("GAME.DOC") and a support file ("GAME.DAT").

The EASIEST way to make a bootable, instant-play copy of GAME for XFormer follows:

In MSDOS:
COPY BLANK.XFD GAME.XFD
XFORMER DOS25.XFD GAME.XFD GAME.ARC
In Atari DOS:
L (load) UNARC.COM
In the unARCer program:
A (unarc) D3:GAME.ARC (source) D2: (destination)
Quit back to Atari DOS:
E (rename) D2:GAME.COM,AUTORUN.SYS (make it auto-load on boot)
H (write DOS) 2 (drive 2) Y (yes) (make the disk bootable, of course!)

Now, to automatically start XFormer with that game, just go:

XFORMER GAME.XFD in MSDOS

The things that will happen are:
(1) DOS.SYS is booted
(2) AUTORUN.SYS is loaded

For MyDOS, remember that autorun fileS are named "filename.AR#" where
"filename" is whatever the name is (or whatever you want it to be), and
"#" is a number from 0 to 9 (MyDOS first loads "*.AR0", then "*.AR1", etc.
if any of them are found, otherwise (and afterwards) it returns to the DOS
menu (DUP.SYS))

Now, say you got some DCM (DIskCommunicator 3.2) disk images... you don't
need to do something like this:

MSDOS:
COPY BLANK.XFD ABC.XFD
XFORMER DOS25.XFD ABC.XFD ABC.DCM
Atari DOS:
load DiskCommunicator
DiskCommunicator
tell it to expand the disk image "D3:ABC.DCM" onto D2:

you can simply get a copy of the latest version of DCM2DSK or DCMTOATR
and convert the DCM into an ATR (SIO2PC/PCXFORMER disk image) disk image
in MSDOS like this:

DCMTODSK ABC.DCM ABC.ATR

or

DCMTOATR -Q ABC

Good luck and read my FAQ! ("Unofficial Atari 8-bit New User, Emulator Help
FAQ v.0.7")

: >What is with the ATARI Driving Controller? This is the controller that looks

: I don't know any specifics about interfacing with the steering controllers but

The Driving controllers work just like the steering wheel did in the Night Driver arcade game, though using mechanics instead of optics. (I believe the N.D. was optical) Depending on which way you turn the controller, a different set of pulses is set. One way sends back (in joystick terms) forward, fwd+back, backward, no-direction. The other way reverses the series.

Unlike 'absolute' positions like the Paddles, the D.C.s can freewheel and state rate of change, and the 'position' is kept track of in the computer. If the wheel in my Night Driver arcade machine ever breaks down, it looks as if one of the D.C.'s will at least sort of work, though not with that optical smoothness. Just if anyone ever has an oppurtunity to hack one.

: I believe that a pair of steering controllers only came with the Atari 2600
: game Indy 500. I haven't seen any copies of this around for years and it used
: to be one of my favourites. The only problem is the controllers, when damaged,
: are hard to replace.

The design is much like a mouse, which uses a similar method to determine direction and rate of movement. I would think one of those 'Driving Wheel for your Mouse' type things, which put a mouse on the shaft would work for this purpose, though the speed may be way off. Anyone want to try a conversion?

: :more stuff to the drive. I don't know what this error code means, since I don't
: :have a copy of the MyDOS docs. I can only guess - is it a disk full error?
: :Can anyone offer any hints on what's up?

: Well, I did manage to get the manuals, and the errors I'm getting seem to
: be timeout and device not found errors. I'm not sure why I'm getting these
: - could I have a bad SIO2PC cable? I don't think it's the PC - I've got an
: old Epson 386sx with a 65 meg hard drive that I've dedicated to SIO2PC
: duties....but I've had the same problems on my Dell Pentium 60.

: I've actually managed to get this to work on a moderately large (16384
: sector) drive. But I will still occasionally get error 130s or error 160s
: when I attempt to copy to them. It got to the point last night, after
: successfully filling up about 1/3 of the disk, that ANY attempt to write
: more stuff to it resulted in an error 160.

: AHHHRRGH! HELP! This stuff is SO cool, but it's getting pretty
: frustrating....

Your not running windows or some other multitasking (sic) layer are you?

These programs will inturrupt the transfer of data from pc<->atari and
may cause an SIO timeout. Try doing a real mode boot with no TSR's
loaded and see if that helps.

Also, try using the sio2pc cable by itself with no other devices, something
may be going online when it should not. I have an Indus GT that does
that occasionally.

: I'm looking to get a monitor for my 800XL so I don't have to tie up the TV
: set all day. It's been a while since I've used a monitor on an 8-bit, and
: I don't have any manuals - what exactly do I need in the way of a monitor
: and cables? And where's the best place to find them? Thanks in
: advance...

The 800XL has a Super VHS style output. Though back then it was called Luma/Chroma. I think it is the same as modern ones, the 800XL being a 5-pin DIN jack. One pin is composite color, one is strait luminance, one is chromiance (though I have heard on at least some 800XL's, it isnt hooked up), one audio, and the last I think is a ground.

If you cant buy a cable, you should be able to make one fairly easily. The C-64 used a similar, possibly identical cable. It works for composite, though maybe not Luma/Chroma. (I actually use a C-64 cable to hook my 800XL up to my composite monitor.) If you want L/C output on an 800XL that doesnt have a chroma output, wire the composite color to the chroma input and it will work almost as well.

As for what kind of monitor to use, you will need an older style composite (B&W or color) like used with the Apple 2, C-64, etc. Since these monitors are hard to find, it may just be better to buy another TV...

Having recently played with "Inside Atari Dos" for dos 2.0s and now
having a nice Double Density version working on my Indus (ahahhahaha)
I started diving into Dos2.0d.

If anybody has source listings or any dos 2.0 utilities from ATARI
for 2.0D or 2.0SD please let me know.

I recenlty ran across a program called "fixdump Dos 2.0SD 10/3/1980"
"FOR INTERNAL USE ONLY" it looks like a pre-coding of diskfix from
dos 2.5. Allows for sector editing, chain mapping, vtoc editing...
very nice... wish atari had released that.

I am still looking for 815 drives!!!! I would like to atleast
have 1 in my lifetime. anybody got one to part with?
also.. any manuals on dos2.0D would be very NICE!!!

Also, anybody know if AC is still publishing? I would love to write
an article about all this nice stuff =)

The author of "Inside Atari DOS" has no knowledge (or so I gathered
from back COMPUTE! issues) or rather history of what dos2.0d was all
about. Interesting though, how it can switch densities on my 1050's
and INDUS. Percom must have worked somehow on this in order to
support the configuration block.

If anybody has any info on any of these ramblings..let me know..
I havn't been this interested in burried atari knowledge since the
1090's and 14xxXLx's.

Andrew

From: kendrick@zippy.sonoma.edu
Message-ID: <3r11nq$9ku@nic-nac.CSU.net>
Source record: 91084

Ok, I've seen "Bros" and it's a pretty poor excuse (not to mention HARD to play, esp. jumping, _esp._ with a Sega controller)..

What else is out there already and where can I get it?

And speaking of them, add yet ANOTHER game to the list of games I'm working on.. I don't know what to call it yet, but it steals a lot of SMB stuff (turtles, bad mushrooms, spiny guys w/ eggs, working pipes, springboards, fish/birds, squids, etc... to be honest, too much stuff to handle!) AND it's going to be in UltraColor IRG mode (IRG5: 40 x 12 x 9 color characters)

I've already tested some of the graphics and it looks pretty nice (of course a bit flickery but I think I'm going to try to hack an APAC/CV type DLI.. hmm.. i wonder if Flick80 mode would look much better with that?)

Source record: 91085

Unfortunately, last I've heard, SpartaDOS still refuses to work with Xformer. Get ahold of the following files: mydos453.dcm and dcmtoatr.zip or dcm2dsk2.zip

The first file is a compressed disk image made with the Atari program "Disk Communicator 3.2". The other two are both programs for the PC which convert .DCM files into SIO2PC .ATR files. (SIO2PC is the "fileserver" like software/hardware setup for PCs which makes the PC think it's an Atari disk drive. PC Xformer also supports .ATR files and I and others prefer .ATR files over the older, less versatile .XFD format.)

All you need to do is download both the .DCM file and one of those programs and then process the DCM file and you can boot XFormer with the newly created ATR file (and you can go ahead and delete the DCM file).

A few things to remember:

(1) "DOS" command in BASIC gets to the DOS interface (menu)
(2) "L" in AtariDOS and MyDOS loads an executable
(3) "LOAD "D:FILENAME.EXT"" loads a BASIC program in BASIC
"RUN "D:FILENAME.EXT"" loads and runs a BASIC program in BASIC

For more details, see my "Unofficial Atari 8-bit New User, Emulator Help FAQ" to be posted in a moment to both comp.sys.atari.8bit and comp.emulators.misc.

164. HP 22707F FX-80 Emul Cart for DJ500

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-06 00:00:00 UTC
From: mpook@freenet.niagara.com
Message-ID: <D9ro1H.Es2@freenet.niagara.com>
Source record: 91088

I have recently purchased a Hewlett-Packard DeskJet 500 printer.
It works fine, but not all my software supports this printer.
I understand that the HP 22707F Epson FX-80 Emulation Cartridge
is still available from mail order sources, including HP Direct.

Would someone who already has this Cart, please advise me if it
correctly emulates graphics modes of a FX-80. I would like to
use my DeskJet 500 with programs like Printmaster Plus, Print
Shop, and others that have graphics output but no printer driver
available for the DeskJet 500. Hewlett-Packard (Boise)
was kind enough to FAX me copies of the following documents;
"DeskJet Epson FX-80 Emulation ERS" and "Using the HP22707E
or HP22707F Hewlett-Packard EPSON FX-80 Printer Emulation
Cartridge". Both documents do not specifically state that
the cartridge will emulate Graphics Modes control codes,
but neither do they state that it is NOT supported. The local
HP Customer Information Centre and HP DIRECT Customer Support
(Mississauga) have been unable to answer my question.

Please respond via E-mail. Thank you.

165. Long Island AtariMeet!

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-06 00:00:00 UTC
From: b.poehland@genie.geis.com
Message-ID: <199506070457.AA052951045@relay1.geis.com>
Source record: 91204
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

June 6, 1995

Fellow Atarians!

Get a pencil and mark your calendars! Grab a phone and call your friends! On June 17th, 1995, NEAR*US will be having an AtariMeet on Long Island!

What's an AtariMeet? Well, it's a get-together with other Atarians from around the NorthEast. It's informal with guest speakers, demos, and Atari goodies to buy, sell & trade. It's where to meet people interested in Atari computers and related products. It's a place to make friends with common interests. It's a place to share information, tips and techniques. Best of all, attendance is FREE!

Our main speaker will be from Wizztronics. Wizztronics continues to support the Atari community with many products like CartMaster, Compatibility Plus, Deka 2 Keyboard interface, and the Falcon Rack. They have brand new products including the Barracuda 040 Accelerator for the Falcon 030 and are continuing work on a several new and exciting projects. This is your chance to find out all the latest, right from the source!

At this time, several other notable Atari developers/vendors have expressed real interest in attending. They represent both 8-bit and ST areas. Some have not committed as of this date, but Nir Dary of OHAUG has shipped his PAL-upgraded 130XE to Ben Poehland in Pennsylvania. Barring unforseen mail snafus, Ben plans to demonstrate this latest 8-bit upgrade which reportedly permits North American 8-bits to run European PAL software without compromising the ability to run NTSC software as well.

There will be tables available for vendors, developers & users wishing to sell and trade Atari related items. Reservations for tables are required, and a small donation is requested to help offset costs. If you are interested in reserving a table, please contact me ASAP!

If you are a vendor or developer of any Atari related products and would like to address the group and/or demo your products, there is time to make your plans right up to the day of the AtariMeet! We want to meet you and will be keeping this AtariMeet as informal as practical to accommodate all interested parties.

During the last 8 months, NEAR*US meetings have drawn Atarians from Connecticut, Massachusetts, New Jersey, New York, and

Pennsylvania. Atarians using many different platforms and with varied backgrounds and skill levels found many common interests, but all with a need for support! Finding support is what NEAR*US is about!

Jonathan C. Mordosky
NEAR*US Interim Chairman

If you need further information, would like to reserve a vender table, or represent a Atari supporting company and would like to address NEAR*US, please feel free to contact me at the following:

on GEnie: J.C.MORDOSKY
on the Internet J.C.MORDOSKY@genie.geis.com
on the IAN & NEAR*US Nets: Jonathan Mordosky
on ACUTE BBS (610) 261-0620: Feedback to SysOp
via US Mail: Jonathan C. Mordosky
P.O. Box 796
Whitehall, PA 18052-0796

What is NEAR*US?

NEAR*US is an association of 8/16/32/64 bit Atari users. It is in a continuing process of reformation. It is non-profit and self-funded. It is not affiliated with Atari Corporation, its subsidiaries or any commercial enterprise. We do not support piracy either directly or implied, or the use of computers for any illegal activity. A short history and more information about past meetings can be found on GEnie and many BBSes.

NEAR*US AtariMeet

Saturday, June 17, 1995 - 12:00 AM to 5:00 PM

Admission is FREE!

Plainview-Old Bethpage Library
999 Old Country Road
Plainview, New York USA

The Plainview-Old Bethpage Library is located in the middle of western Long Island in New York. It is located on a major roadway and is easily accessible from major highways.

Directions from the Long Island Expressway:

Take the Long Island Expressway to Seaford Oyster Bay Expressway (Rt. 135). Take the Expressway south to Exit 10 (Old Country Road). Travel east on Old Country Road about four (4) blocks, the library is on the right. It is a large library with a parking lot in front. Across the street is a large shopping area. The meeting rooms are in the basement.

Directions from the Southern State Parkway:

Take the Southern State Parkway to Exit 28AN (not 28N), the Seaford Oyster Expressway. Take the Expressway north to Exit 10 (Old Country Road). Travel east on Old Country Road about four (4) blocks, the library is on the right. It is a large library with a parking lot in front. Across the street is a large shopping area. The meeting rooms are in the basement.

but to me, it's great news!
/
I'm an IDIOT! :) I can't do math or something... I for some reason
thought that IRG mode has 64 characters, not 128 available at a time!

Because of that, I limited my SMB game's UIRG chset to 32 2-character-wide
shapes. Now, after starting work on it, I find I have 32 MORE 2-ch-wide
shapes I can add! AMAZING! I may actually get in all of the nasties and
backgrounds and foregrounds from the NES SMB into my XL SMB! NEATO!

Well, with 32 characters to spare (it for some reason doesn't sound like
much, but now that I've gotten the overhead of MOST of the enemies and
90% of the NES version's background shapes done with, it's nearly all free!)
does anyone have any spiffy ideas for me to add to good ol' Jump&Run? :)

I've already added a "clock" weapon to freeze the enemies and countdown
clock... :) (oops.. I need to remember to add a DLI to give me text chars
somewhere on the screen too! :))

(And how about a name? So far it's "GAME.ACT" :))

From: kraemer@ranec.mathematik.Uni-Osnabrueck.DE
Message-ID: <3r4eju$da7@deimos.rz.Uni-Osnabrueck.DE>
Source record: 90958

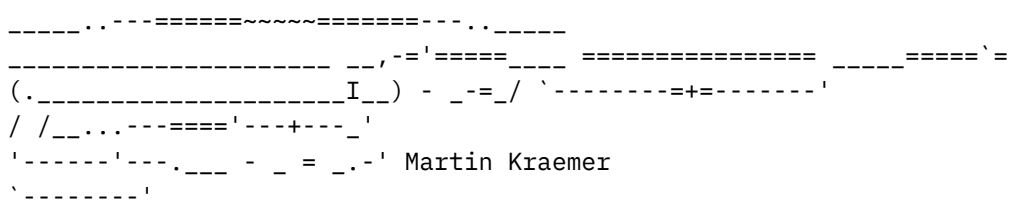
Hi,

I want to connect a Atari 800 via Atari 850 "R1"-port to my PC.
I have built a null-modem cable with the right pin-layout, but
now I need the parameters for setting the baud-rate, stop-bits
and such things, i.e. the meaning of the two aux-bytes in the
open command (OPEN #1,AUX1,AUX2,"R1:").

A further question is than, what programs I used best (error
detection/correction!!) for transferring many files from the
Atari to my PC (MS-DOS, OS/2 or Linux)?

Please e-mail also to me, because I can't read the news group every
day.

Thanks and bye



Martin Kraemer

170. unix2atr.c 0.5 released

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-07 00:00:00 UTC
From: crow@coos.dartmouth.edu
Message-ID: <3r5brt$8lc@dartvax.dartmouth.edu>
Source record: 90959

```
Unix2atr: Convert a Unix directory tree into an ATR disk image file,
using the MyDOS format for subdirectories.

unix2atr [-dump] #sectors atarifile.atr [directory]
Flags:
-d Double density sectors
-u Convert filenames to upper case
-m MyDOS format disk image
-p print debugging stuff

I'm releasing a partially-functioning version of unix2atr.c. It's not
fully tested, and is missing some of the functionallity that is
required for real use (writing the boot sectors and the bitmap). I
may not get to this again for a while, and the documentation I've
found on the formats for the boot and bitmap sectors is a bit sketchy,
so I would really appreciate it if someone else would like to help out
and get it completed.

I hav't tried his method but if you can't seam to get it to work save yourself the trouble and download my hand-made pre-formated sparta dos images.

There avalible at ftp.clark.net:/pub/atari/spartad. Be sure to first see the readme file in that dir.

: There are problems with all the formats. I don't know much about the
: XFD format, but I think that it, like DCM, is restricted in the size
: of the disks that can be represented. ATR is the only format that is
: general enough to support arbitrarily sized disks of both single and
: double density.

: Unfortunately, ATR has several shortcomings, itself. First, it only
: stores 128 bytes for the first 3 sectors, regardless of the density.
: I don't have a real DD drive, but I suspect that they are physically
: DD sectors, even if the standard DOS boot code uses them as 128-byte
: sectors.

Even if you look at the disk level magnetic domains and see that the
drive controller is writing DD sectors, facts are that no atari drive
will return 256 bytes on a call to sectors 1-3.

Filling 129-256 of sectors 1-3 in the ATR image would actually make
managing the file easier, but its honestly pointless.

:Second, it doesn't allow for the storing of copy-protection
: data. This is critical for those who wish to completely eliminate the
: use of their Atari drives.

This is pretty much impossible. There are forms of copy protection that
would be extremely difficult/impossible to emulate with software drive.

Crc: Easy.
Bad: Easy.
Phantom: Ok, possible.
Crc/Phantom Combinations: Errr, if you stretch it.
Drive Timing: Ok.

Drive Timing + Skewed Sectors: ok
Drive timing + Specially formatted Tracks + Crc + Phantom...

Yes, I know of many disks that get this gruesome and even worse. A better solution is to provide patches/unprotected versions of these titles. I dont know of any 8 bit title that has not been made SD compliant, including Alternate Reality, EA, Synapse and other super-protected titles.

: So my proposal is: Enhanced ATR.

: For disks where the ATR format is sufficient, the old ATR format is
: used. For other cases, the checksum is incremented by one,
: indicating:
: * If the disk is DD, even the first 3 sectors are stored as DD sectors,
: regardless of how the program returns the data to the Atari

I really have to ask WHY on this? No drive will send 256 bytes.

: * Before the first sector, a series of copy-protection information bocks
: are added with the format:
: 2-bytes: number of blocks
: For each block:
: 2-bytes: length of the block (at least 4)
: 2-bytes: type of the block
: 0+ bytes: type-specific data
: The definition of the copy-protection blocks will be left unspecified
: until someone decides to implement one, at which time, the type number
: will be reserved once the implementation is announced. With a
: community as small as ours, this should work--there aren't too many
: people implementing emulators or SIO2PC servers.

Again, copy protection on the physical disk is just far too complicated for software emulation IMHO. Even if I were to plug such excessive futurism in the emulator, you would require:

1) a pc -> sio cable to talk to modified physical drives (archiver, etc)
2) a gruesome detailed knowlege of such devices in order to obtain and understand the raw images.

Just my 0.02 :)

Steve

#==========William Kendrick, 6/6/95==========
#
(4) I'm beginning to think we (or perhaps I? :)) need a
#c.s.a.8.binaries newsgroup.

I would suggest that we use c.b.a.st as a group that we can
all relate to. I'm not too sure how the ST users would feel
about that or whether it violates some group charter, but it
is as close as we can get to an 8bit Atari group. Unfortunately,
there isn't even a misc binary group.

Obviously, we would have to preface the subject with something
meaningful like 8BIT: or XE: but it should be doable.

Hmm... good excuse (all XL/XE users having SIO2PC) UNTIL an ATR2DCM program comes out.. then you can simply convert all of those bloated ATRs back into DCMs so Atarians without SIO2PC (and those with SIO2PC, thanks to DCM2DCM/ DCMTOATR) can use them.. (if you ever get users on your BBS who dont have SIO2PC :))

There are problems with all the formats. I don't know much about the
XFD format, but I think that it, like DCM, is restricted in the size
of the disks that can be represented. ATR is the only format that is
general enough to support arbitrarily sized disks of both single and
double density.

Unfortunately, ATR has several shortcomings, itself. First, it only
stores 128 bytes for the first 3 sectors, regardless of the density.
I don't have a real DD drive, but I suspect that they are physically
DD sectors, even if the standard DOS boot code uses them as 128-byte
sectors. Second, it doesn't allow for the storing of copy-protection
data. This is critical for those who wish to completely eliminate the
use of their Atari drives.

So my proposal is: Enhanced ATR.

For disks where the ATR format is sufficient, the old ATR format is
used. For other cases, the checksum is incremented by one,
indicating:
* If the disk is DD, even the first 3 sectors are stored as DD sectors,
regardless of how the program returns the data to the Atari
* Before the first sector, a series of copy-protection information bocks
are added with the format:
2-bytes: number of blocks
For each block:
2-bytes: length of the block (at least 4)
2-bytes: type of the block
0+ bytes: type-specific data
The definition of the copy-protection blocks will be left unspecified
until someone decides to implement one, at which time, the type number
will be reserved once the implementation is announced. With a

community as small as ours, this should work--there aren't too many
people implementing emulators or SIO2PC servers.

I've got an Atari 800 that freezes shortly after bootup, and has a kind of sticky keyboard. I got it in this condition (it also has someone's name carved with a knife into the side) hoping to augment my Atari collection with a 4-controller port 8-bit for Asteroids, etc... but it won't even get that far. However I imagine there might be a diehard or two out there that would either want to try to heal this old warrior or canabalize its parts to restore another 800, and I would be happy to mail it to someone for $10 + whatever it costs to ship it.

It has the ROM module and a full three 16K RAM modules. They look fine. I don't have a spare power supply or cables or basic cart for it, though.

Email if interested.

Ok. I guess I was wrong on that point. I still find it very odd,
since the number of boot sectors is determined by the software--this
would be a real pain for anyone who re-wrote the DOS boot code to use
only 1 or 2 sectors (I'm quite certain that this could be done.)

>:Second, it doesn't allow for the storing of copy-protection

Right. The point is to minimize the number of disks that require an
actual Atari drive--we might not get them all to work, but we can get
a lot of them.

>Yes, I know of many disks that get this gruesome and even worse. A better

I wouldn't expect every emulator to support every type of
copy-protection, but that's the point of an extensible format. And
yes, it might be a pain to create the images, but it's can be much
simpler than cracking the copy-protection.

Bill, have you done a lot of stuff with DCMTODSK? I think some of the complaints people have been making about things not working my have some validity. I finally FTP'd to the archive & downloaded several Sparta related files in the /bin mode. Turned out FTESD32F.DCM crashes DCM2DSK after about 130 sectors. Ditto for Disk RX and if I recall correctly, 32g ARC file gave a CRC error. Same thing with sio2pc 3.19 listed as the .EXE, won't run, self extract, or unarc for me. I repeated most of the down loads & ran MS DOS FC on them, no differences. It could be that I was doing everything exactly wrong the same way every time, but I'm awfully suspicious there's some busted files there.
Rick

The demo version of my graphic adventure game, FREE, is available in at least
two FTP sites, that is:
umich (atari.archive.umich.edu) and its mirrors (wuarchive.wustl.edu and others)
in atari/8bit/Games
Jeking (ftp.xmission.com) in pub/users/j/jeking/8bit/games as ATR or DCM files.

You are free to download and distribute these files.

ENJOY!

194. Lemmings for 8 bit

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-08 00:00:00 UTC
From: Marek Wojciechowski 19-93 Bp4 <mw@altis>
Message-ID: <Pine.SOL.3.91.950608123307.12300A-100000@altis>
Source record: 90966

Does any body know whether Lemmings for Atari XL/XE has been released ?
Some time ago there was an article in Polish magazine "Magazyn Atari" with
several snapshots of the game and information that it's going to be released
soon :)

Perhaps somebody know (especially Polish atarians) if it's available anywhere ?

Marek Wojciechowski

195. MYUTIL woes (IBM -> Atari disk transfers)

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-08 00:00:00 UTC
From: rumpf.1@osu.edu
Message-ID: <199506081556.LAA13344@postbox.acs.ohio-state.edu>
Source record: 90967

Okay, chombattas, here's the deal. I dl'd MYUTIL and some Atari progs, put it all on a 3.5 PC disk. Formatted a single-density Atari disk with my Indus GT drive. Took them both to a local PC and shoved 'em in the drives. Ran myutil with the following parameters:

MYUTIL -wb b: arcx.com

Hoped this would write (in binary format) the file arcx.com onto the Atari-formatted 5 1/4 disk in drive b. Instead I got an error saying that the Atari VTOC couldn't be read. WHAT DOES THIS MEAN? Argh. I'm planning on going null-modem as soon as I can get my hands on an 850, but for now it sure would be nice to transfer files this way...can anyone help?

The 5.25 floppy should be formatted in Double Density. True double density
that is. (720 sectors, 256 bytes/sector)

Preston; all Atari drives have single density sectors for the 1st 3 sectors.
Matter of fact, I think IBM may do the same thing, but it's irrelevant.
One scheme is as good as the next, but you may want to change your concept
a little for compatibility. For instance, I don't know of a single copy
protected disk that is anything other then single density or enhanced density
so supporting double density is really not necessary. Since you only have
to support 720-1040 sectors a bit map in the sector 721 or 1041 would
probably be all you need to ID stuff. Nothing ever came out with 720
copy protected sectors or 1040 for that matter so about 5 bytes would be
be enough to flag 40 or so sectors. If you stick whatever you want on the
end, stuff may still work with existing software. Wes Newell just said he
created a large SD image by binary loading a small one into his EPROM
burner software, changing a device ID to a huge EPROM & I think a couple of
bytes for disk size, then wrote the whole thing out as a single file. I
could check & see if this type scheme would work with most software since
I have most of it. Just a matter of how SIO2PC, PCXformer determine how
many bytes to load & allocate memory for it. If it doesn't work having
a few extra bytes on the end, it would be better if you kept any schemes
in a seperate file.

Ah. But MyDOS supports 256-bytes in sectors 1-3. Check the docs.
Don't know if any drives support this, but the software does :)

200. Re: ATARI Driving Controllers

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-08 00:00:00 UTC
From: BRYEDEWAARD@news.delphi.com
Message-ID: <3r7e3h$cup@news2.delphi.com>
Source record: 90972

The driving controller is more like a mouse than a paddle. The paddle returns a variable resistance which changes the time a capacitor takes to charge. On the 2600, you actually have to check in a loop to see how many cycles it takes for the cap to charge, but on the 800, there is a crude A/D circuit to make this number a nice register value. (The PC, BTW reads its analog joystics via the 1st method).

The driving controllers, on the other hand, return alternating patterns of joystick up & joystick down. This makes it work like 1/2 of a trackball or ST/Amiga mouse (PC mice work the same way, but have an extra serial interface). If the paddle is turned one way, you get:

(U=up, D=Down, B=Both, N=None)

N,U,B,D,N,U,B,D,N....

turn it the other way, and you get:

N,D,B,U,N,D,B,U,N....

so you can easily tell direction from the returned pattern. The driving controller only has 16 positions per rotation, so it can easily be checked via a VBL routine.

-Bry

You missed the most important one, IMO; no compression. The ATR format stores 128 or 256 * nsectors, no matter how many of the sectors are actually used. Some form of compression should be used, or at least some way of flagging sectors as blank, and not storing them in the file.

(1) RGB output out of an Atari is quite difficult.. not worth the hassle.
Two choices: Go chroma/luma (unfortunately 800XLs, at least most of
them I think, don't have the chroma out, so at best you get B/W or
can steal the composite and make it pretend to be chroma). That
needs a 4-RCA-out monitor cable. Oh, and a supporting monitor like
the Commodore 1084.
Or, get a SuperVideo upgrade.. I know little details on it but it
was published in _Atari_Classics_ a while back. Ben Poehland knows,
of course.. I think it's his hack.. :)
(2) Dunno about hooking up different CPUs (65c02) in replace of the 6502c
or whatever it is.. probably won't work :) .. but for $70US or so
you can get a Sweet16 65816 CPU upgrade from Fine Tooned Engineering.
Or of course you can contact one of the US Atari vendors like BEST
Electronics (they've got most everything!) and get a new CPU.

#==========William Kendrick, 6/7/95==========
#
#I'll look INTO it.. (said melodically with a lot of pessimism :) )
#but I really dont think the c.s.a.st'ers would like us posting
#our binaries
#to their group... unless we called them "STXF files" or something <hehe>
#:)

To a degree, that was my point. Many ST'er were 8bit users at one time
and a lot probably have 8bit emulators for their ST's. Even those that
don't probably would be sympathetic to Atari 8biter's who have no place
else to post binaries. Besides, I don't think that the ST binaries group
is all THAT busy. I haven't checked lately though, so I have to qualify
that a bit.

There really should be a misc group for binary posting for the rest of the
machines that don't have a binary group.

: >Even if you look at the disk level magnetic domains and see that the
: > drive controller is writing DD sectors, facts are that no atari drive
: > will return 256 bytes on a call to sectors 1-3.

: Ok. I guess I was wrong on that point. I still find it very odd,
: since the number of boot sectors is determined by the software--this
: would be a real pain for anyone who re-wrote the DOS boot code to use
: only 1 or 2 sectors (I'm quite certain that this could be done.)

Actually its not very hard. I think DOS 2.0 only uses part of sector
1 for its boot code. All this code has to do is locate DOS.SYS, load
it using the next-sector markers and then pass control.

You can do quite alot in 375 bytes of 6502 machine code :)

: >:Second, it doesn't allow for the storing of copy-protection

: >Drive Timing + Skewed Sectors: ok

: >Drive timing + Specially formatted Tracks + Crc + Phantom...

: Right. The point is to minimize the number of disks that require an
: actual Atari drive--we might not get them all to work, but we can get
: a lot of them.

: >Yes, I know of many disks that get this gruesome and even worse. A better
: > solution is to provide patches/unprotected versions of these titles. I
: > dont know of any 8 bit title that has not been made SD compliant, including
: > Alternate Reality, EA, Synapse and other super-protected titles.

: So are you going to provide copies to us? I think emulating at least
: the simpler protection schemes is a better idea.

I think your missing the point. 50%+ of copy protected disks work in such
a way that not only would you need to know exactly how the disk was
laid out physically, you would absolutely have to know what the program
was doing with that data.

And if your going to disassemble to program to find out what timing values,
CRC values, and 1771 status bits its expecting during the proctection check,
its far easier to just crack it while your in there and forget about it.

: >: So my proposal is: Enhanced ATR.

: >: For disks where the ATR format is sufficient, the old ATR format is
: >: used. For other cases, the checksum is incremented by one,
: >: indicating:
: >: * Before the first sector, a series of copy-protection information bocks
: >: are added with the format:
: >: 2-bytes: number of blocks
: >: For each block:
: >: 2-bytes: length of the block (at least 4)
: >: 2-bytes: type of the block
: >: 0+ bytes: type-specific data
: >: The definition of the copy-protection blocks will be left unspecified
: >: until someone decides to implement one, at which time, the type number
: >: will be reserved once the implementation is announced. With a
: >: community as small as ours, this should work--there aren't too many
: >: people implementing emulators or SIO2PC servers.

: >Again, copy protection on the physical disk is just far too complicated
: > for software emulation IMHO. Even if I were to plug such excessive

I recall awhile back there being a rather large atari 8 bit BBS in
new york (?) that supported 14.4 and was the home of some BBS program.

Anyone have this #?

Steve

>is as close as we can get to an 8bit Atari group. Unfortunately,
>there isn't even a misc binary group.

There is alt.binaries.misc, which Bill Kendrick has used some.

I explored using comp.binaries.atari.st and comp.sources.atari.st ages ago.
The moderator was adamantly against the idea, due to the many automated
archives
created out of postings on those groups.

We don't need a binary group anyway. Our major archive at Merit/UMich is
easily accessible by e-mail, FTP, AFS, and Gopher. Who here can't do any of
those?
(Yes, there are Usenet participants who really can't do any of those, i.e.,
Usenet sites that *aren't* on the Internet, but they are quite rare by now.)

Binaries people wish to share should be e-mailed, FTP'd, or AFS'd to
Merit/UMich, or whatever your favorite Internet site is these days. Binaries
of any length should not be posted on comp.sys.atari.8bit for a variety of
reasons.
Do we need to rehash those reasons again?

Message-ID: <h028FU5.lmcclure@delphi.com>
Source record: 90995

In a message dated 6-5-95, Winston Smith said:

"The regular mini-8 to D-25 cable I can pick up at my local
computer outlet does not appear to work with any MAC 512K I
have encountered."

Um, if you were really using a cable with a mini-DIN 8, you must have had a problem plugging it in, as the first Macs (including the 512K model), used a DB-9 for the serial ports. (I believe the change to the mini-DIN 8 occurred with the Mac SE, as the Mac Plus was still using the DB-9 ports).

For the moment, I will assume you had tried to use a standard DB-9 to DB-25 modem cable, which is actually intended for a PC AT or compatible. For a proper Mac modem cable, you might check at places such as Office Depot or Computer City, or check the pages of Computer Shopper, or the back pages of one of the Mac mags.

Just be certain to get the modem cable (to use with a female-to-female null modem cable to use with the modem cables on your Mac and Atari 8-bit), rather the printer cable, which appears to be identical, but is wired differently.

One place to find the cable you need is Cables America (1-800-348-8648). In the June issue of Computer Shopper, they list "6 ft. Mac+ to Hayes Modem Cable" for only $2.25 (and $2.75 for the 10 ft. version).

Source record: 91002

: Ok, the version there now will create a new file after cleaing up all
: the garbage. Specifically, it:

: * removes secondary FFFF headers appearing before load blocks other
: than the first one in the file (I found real cases of this).
: * discards any load block loading only a single byte into an address
: where the high and low bytes are the same, along with any
: remaining data in the file (Usually indicitive of XMODEM padding
: data).
: * moves the run address, if found, to the end of the file.

There's a really nice program, Streamliner by James Hague, which not only
does the above but also compresses adjacent binary loading blocks,
which makes files created with certain lowly assemblers (which includes
Mac/65) load faster. It doesn't mess with init addresses and such though..

I don't know whether it's up at umich, in any case I have it. It's a very
short binary file.

Don't know, never dared to use it. I suspect most drives won't use
the full 256 bytes anyway, and the boot will presumably fail if the
Atari expects 256 bytes and the drive only sends 128. But, for stuff
like SIO2PC (and the RSN-and-has-been-for-a-while SIO2Amiga), it might
be useful.

Ah, yeah, should have thought of the problem with writing to
compressed ATRs. The reason I'd like to see a compressed format isn't
that I lack HD space, though, it's because it's impossible to put a SD
.atr-file on a SD floppy. So, it looks like DCM is gonna be around
for a while longer.

Ah, but if you compress ATRs it becomes EXTREMELY difficult to write back to them.. For example, SIO2PC has 540K of free space. I have a 720K boot disk with MyDOS and a ton of utilities.

If I were to create that 720K disk image, it'd have to be access physically.. I'd end up with a tiny .ATR file (since nothing is on it yet) so writing to it would be tremendously slow, especially on my 4MHz PS/2 which takes 15 seconds to load a >200K< file!

I believe PC Xformer also does physical access to disk images...

Telling a filesystem "go to byte XXX of the file" is relatively simple (extremely simple on most filesystems, in fact), but having to somehow stick an extra sector inside the middle of a file is quite difficult at best, I'm sure!

And THAT's why ATRs aren't compressed..

Now, being able to, say, compress/uncompress ATRs (quickly) when opened and closed (again, _not_ loaded and saved.. hell, I NEVER load any ATR images in SIO2PC.. it's just too slow, even 90K SD ones!) would be real nice!.. of course, you'd need XX free space on your PC when you do that though.. (say you had a 720K disk image which was compressed down to 20K (ie, it was pretty empty).. when you open it, an uncompressed copy is accessed... now 720K more is being taken up. Then you fill the disk.. At this point, you have ORIGINAL.ATR: 20K, UNCOMPRESSED.ATR: 720K. You close the disk image. ORIGINAL is deleted, UNCOMPRESSED gets compressed.. say it doesn't save any space compressing it, it's now 720K as well. For that instant, you have 1440K of space being used.. yikes)

I think that Bill's problem with umich is that nothing ever gets
deleted (look at all the versions of sio2pc there!), and he wants to
make binaries available that nobody will care about in maybe a few
months.

Bill, I think the best solution for what you want to do may be to just
make the things available at your site by FTP or WWW. Then announce
it on the newsgroup. If (like me) you can only put things up for WWW
access and not FTP, have people who can't do WWW ask you to email it.

The Atari 6502 (actually 6502C) has some extra logic that isn't in
standard 6502's and their descendents. I believe early 800s had that
logic on the board, and used the standard CPU.

There are 65816 upgrades, though. They put that extra logic on an
adapter board, which could conceivably also be used to adapt a normal
6502 or 65C02.

Psygnosis, for an unknown reason, created Lemmings for the Commodore 64. A preview of one level (albeit a really lame level) was released a couple of years ago, and the full game a few months later. Lemmings really is more suited to the Atari 8-bit due to all the high-resolution work and the screen scrolling that must be done, but the Commodore 64 versioin has been out, more or less, for over a year. I don't even know if Psygnosis is even selling it.

But you know what, now that the Commodore version has all the levels and everything converted into 160x200-resolution, ambitious programmers could possibly port it if they were feeling really ambitious.. and really lucky, considering that Psygnosis might not like it if someone else came in on this.

Any decent monitor with composite input will do, but I have always been a
fan of the Commodore monitors ( high quality and split video inputs,
sepperate inouts for Chroma and Luminance, very sharp picture. ) I have in
the last 3 months or so gotten 3 different models ( 1701,1702, 1902 ) used
from my local used computer store for about $30 - $40 each and love each
one. Cables can be hand made or gotten at a few vendors in the vendors FAQ (
B & C and Best come to mind. ) Do it, you won't believe the difference!

Yes, it's called "The Brundles" I believe.

Also, ARGS released a little demo (ONLY a demo, there IS no game) which had a Lemmings-like screen (single screen) with tons of little Lemmings-like characters wandering around.

Anyone who knows: How does the Brundles compare to ARGS' Lemmings demo? (Demo's avail. at UMich WRONGLY placed in the Games directory I THINK..)

254. For Sale: Atari 7800 system (mammoth!)

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-09 00:00:00 UTC
From: mrathwel@uoguelph.ca
Message-ID: <3r87r1$a5h@ccshst05.cs.uoguelph.ca>
Source record: 91026

Hi Everyone,

A while back I put my Atari 7800 system and games up for sale.
While I received a huge number of resposes and offers, my annoying system
got rid of many of them so I was never able to get rid of the set,
except for a few of the games. I'd like to try again, now that technical
problems are cleared up and exams are finished with. I have a couple of
rules.

1. I will accept bids on the system from now until June 16th. This
will give everyone a chance to reply, but won't overflow my box.

2. This is not an auction per-say. I will not be posting the highest
bids or anything like that. If people ask, I will tell them what the
current best offer is, but I will not publically state it.

3. I would like to sell the entire set. While I will accept offers
for individual cartridges, I will wait and review them after all system
bids are in and if I haven't seen an offer I like. Things just get
complicated when people try to buy bits and pieces, so I'd like to
seperate the two types of offers. Saves for confusion.

4. I reserve the right to refuse offers if I think the person making
the offer is going to resell my stuff. Some of my things are rare (ie.
the European Joypads) and would rather they went into the hands of a
collector, not a seller. I'm very pro-classic gaming and despite the
practice of people buying up rare games for low prices and selling them
for 5-10 times what they paid. It ruins it for the rest of us.

5. Buyer agrees to pay UPS shipping. UPS is traceable and insurable
at a fair price ... must better than Canada or US post.

6. Please state the funds you are bidding in. If you are bidding in
US funds, you must agree to pay an extra $1.50 to cover the cost of
getting a foreign check cashed at my band.

7. I can't do COD unless you live in Canada. UPS won't allow it.
However, I've done enough net trades in the past so feel free to ask
around about me.

That's about it! Thanks for hearing me out. I hope my rules have
seemed fair. Now, down to business.

This is my darling 7800. This is not an FTP pack, but rather my
own collection built up steadily since 1988. I've invested more than
$1200 in this system, though I wouldn't dare ask for anything remotely
like that now. Everything has been tried and tested and some things (ie.

joysticks, power supply) are replacements from my original setup. I would like to see another classic gaming fan get as much fun out of it as I have. This machine and I have been through a lot together ... including Atari Corporation's horrible customer service ... write me if you want to know some stories! :-)

Included in here are:

1. Atari 7800 console. This is the version without an expansion port. It seems to play "Robot Tank" fine.

2. Two Atari Proline joysticks. These are replacements for the original two that came with the system.

3. Two Atari joypad controllers. These are the rare European NES like pads you see in the "Atari Advantage Posters." They cost me a fair bit to import from Best Electronics, but I found them to be quite worth it.

4. An Atari Lightgun. Zap away with "Crossbow" and "Alien Brigade"

5. One Epyx 500jx joystick. Fits snugly in your hand.

6. Four Atari Cartridge libraries. These interconnect and store 14 carts each. One has never been used.

7. All three issues of "The Atarian" video game magazine. They're in kind of rough shape, but I thought I'd throw them in for nostalgia purposes.

8. Games: (this is what everyone really wants to know)

I got rid of most of the boxes for space reasons, but kept the instructions for almost everything. I could never understand why people got rid of them in the first place. Anyway:

Atari 7800 specific carts
==========
1. Ace Of Aces
2. Alien Brigade ("Operation Wolf clone)
3. Asteroids
4. Ball Blazer (must have!)
5. Basketbrawl
6. Choplifter!
7. Commando
8. Crack'ed
9. Crossbow
10. Dark Chambers ("Gauntlet" clone)
11. Fatal Run (Similar to "Road Blasters)
12. Fight Night
13. Ikari Warriors
14. Jinks
15. Joust
16. Karateka
17. Mat Mania Challenge
18. Mean 18 Golf

19. Midnight Mutants (Awesome quest game!)
20. Motor Psycho
21. Ninja Golf
22. One On One Basketball
23. Pete Rose Baseball
24. Planet Smashers
25. Pole Position II
26. Robotron 2084
27. Scrapyard Dog (Atari's answer to Mario!)
28. Summer Games
29. Super Huey
30. Tower Toppler
31. Winter Games
32. Xenophobe!
33. Xevious

Atari 2600 titles:
==========
1. Adventure
2. California Games
3. Kangaroo
4. Midnight Magic
5. Off The Wall
6. Pac-Man
7. Solaris (INCREDIBLE game!)

Interested? Give me a shout via E_Mail! Thanks again.

I use ANADISK very often, and it can read about 50% of my single density
disks. But it doesn't work on any PC. I had to try three different ones before
it worked. The problem is that you have to try with a disk that you know will
be accepted. But how do you know this?
All this to say that it works on some PCs with very peculiar controllers. And
the only way to know is to try.
Hope this helps.

BTW, try the FREE demo! You can find it in games in xmission and umich.

William Kendrick (kendrick@zippy.sonoma.edu) wrote:

: Ah, but if you compress ATRs it becomes EXTREMELY difficult to write back
: to them.. For example, SIO2PC has 540K of free space. I have a 720K
: boot disk with MyDOS and a ton of utilities.

: If I were to create that 720K disk image, it'd have to be access physically..
: I'd end up with a tiny .ATR file (since nothing is on it yet) so writing to
: it would be tremendously slow, especially on my 4MHz PS/2 which takes 15
: seconds to load a >200K< file!

Exactly! DCM and other compressed formats are teriffic as ARCHIVAL
formats, but not so teriffic as random access formats. Whats involved
with a compression/decompression on the fly file is basically a mini
Stacker type operation. Call STAC, i dont want anything to do with it :)

I suggest if your concerned about the size of the ATR images on your
hard drive is this:

1) Establish a .ZIP file with all your ATR images in it
2) Write a batch file to:
a) Unzip this before SIO2PC starts
b) Update/add any changed/new images opon its exit
c) re-erase the ATR files.

If you think that will be too slow, you dont want on-the-fly compression, which
would be MUCH slower and possibly cause timing problems with the program.

: I believe PC Xformer also does physical access to disk images...

I would think so unless its loading all those images into extended
memory, which I doubt. RAM access is really only required for very slow
machines, and you wouldnt be running an emulator on that anyway. :)

Im currently debating if its even worth the effort to code memory
buffering routines into my emulator. Physical access even on my 386/16
has always been fast enough for the atari, even with 65535 sector
double density images.

: Telling a filesystem "go to byte XXX of the file" is relatively simple
: (extremely simple on most filesystems, in fact), but having to somehow
: stick an extra sector inside the middle of a file is quite difficult at
: best, I'm sure!

Exactly, your looking at:

1) A big in-memory index of where each compressed sector boundry is
2) Rewriting the whole image after every write

I doubt any kind of acceptable speed doing this IN RAM could be achived
even on a 386 machine.

: And THAT's why ATRs aren't compressed..

: Now, being able to, say, compress/uncompress ATRs (quickly) when opened
: and closed (again, _not_ loaded and saved.. hell, I NEVER load any
: ATR images in SIO2PC.. it's just too slow, even 90K SD ones!) would be
: real nice!.. of course, you'd need XX free space on your PC when you
: do that though.. (say you had a 720K disk image which was compressed
: down to 20K (ie, it was pretty empty).. when you open it, an uncompressed
: copy is accessed... now 720K more is being taken up. Then you fill the
: disk.. At this point, you have ORIGINAL.ATR: 20K, UNCOMPRESSED.ATR: 720K.
: You close the disk image. ORIGINAL is deleted, UNCOMPRESSED gets compres-
: sed.. say it doesn't save any space compressing it, it's now 720K as well.
: For that instant, you have 1440K of space being used.. yikes)

After writes to the disk though, your still looking at some kind of
'close disk' procedure before the writes become final in the compressed
image. I personally prefer straightforward physical access becuase of
its simplicity and reliability.

On very slow machines as you pointed out, even loading a disk image
into ram is not worth the time becuase physical access on PC disks
is plenty fast.

The PKZIP idea seems ok to me right now, a batch file for uncompressing
your disks, running atariem and recompressing them would be something
like this:

```
@echo off
C:
cd C:\your\atr\directory
pkunzip atrfiles.zip
call atariem.exe
pkzip -f atrfiles.zip *.ATR (this will only touch files that are changed)
erase *.atr
```

From: wolfgang@connix.com
Message-ID: <3r9e5s$9ki@comet.connix.com>
Source record: 91029

Since I couldn't figure out how to do a direct public reply to many of the messages here, I ended up E-mailing the authors personal replies to many of the topics going on here.

So here's my 2 cents worth.

On the mac Modem cabling. I suggested to find either a standard Mac 512 modem OR Imagewriter cable, whichever is cheaper, getting a null modem adapter, so in the long wrong wither cable could do the function of the other. So if you use the Imagewriter cable alone, it would be like what is known as a null modem cable, and no BBS or modem would be involved, just a direct connection. You could get that same function by using the Mac modem cable with the null modem adapter. And you can reverse the function of either cable with the null adapter (it just switches the send and receive lines for proper handshaking). So go with the one you can find cheaper or availability.

I have the cable that came with the Magic Sac+ Mac + emulator made for the Atari ST. This cable was intended with special software on both ends to transfer an entire Mac disc to the Atari serially, took about 12 minutes a disc.

On the SIO2PC discussion I've been reading:

Someone mentioned they thought the images they were getting were corrupted because the system locked around sector 130. Well I had this problem on my 130XE also, until I realised when I used SpartaDos with Discomm not to use the option "Use all 130XE memory (Y/N)" Well hit N if you have a 130, because in a nutshell SpartaDos uses banked memory (shadowed memory in the PC world) the same memory that Discomm was going to use. So you get memory overwritten and you end up with a lockup. And I know this is the problem, since my computer ALWAYS locked up at exactly sector 130 (if all the sectors till that point contained sectors with data) else you'd get 130 sectors worth of data in the buffer (some sectors were empty to they didn't count).

And the last thing is,,, I'm sour on PC Xformer 3.0 after buying and not getting much support from the author. He can flame me if he reads this, but I went though alot of trouble to get the latest update, and I got grilled from him big time to prove I was an owner, well I did what I had to get proof (hell I payed for this thing!). Well I didn't get the latest update, so I'm thinking twice about purchasing Gemulator 3.0, 4.0, X.0

So if your looking for PC Xformer 3.0, you can buy my original disc for $.25

I don't want to have anything to do with it.

Well whoever was selling illegal copies of PC Xformer, I feel sorry for him.

But some lucky person (ehhu) can buy my original copy for the cost of postage, because I refuse to use it now for bad customer relations.

So if anyone want to have it (can't find the manual) I mail it with an extra disc I can put together with my favorite arcade games). Then you can deal with the author.

Eric

259. Anyone got a reply from Brasoft on XF3.1 upgrade?

Newsgroup: comp.sys.atari.8bit

I purchased Xfrmr 3.0 a several months ago. A few weeks later I got a
newsletter from Branch Always software announcing an update for
owners to 3.1. They said the upgrade could be received via E-mail.
I've sent them two messages in the span of three weeks and heard
nothing back. Has anyone got a reply from them concerning the upgrade
for registered users?

dderhak@xmission.com

William Kendrick (kendrick@zippy.sonoma.edu) wrote:

: Hmm... good excuse (all XL/XE users having SIO2PC) UNTIL an ATR2DCM program
: comes out.. then you can simply convert all of those bloated ATRs back into
: DCMs so Atarians without SIO2PC (and those with SIO2PC, thanks to DCM2DCM/
: DCMTOATR) can use them.. (if you ever get users on your BBS who dont have
: SIO2PC :))

I don't see what your big gripe with ATR image files is. By using PKZIP, you
achieve much better compression ratios on them than you would with DCM.

Oh, by the way, I'm working on the following projects (some are further along
than others)

DSK2DCM - I haven't started yet, but it shouldn't be too hard to do

DSK2FILE - reads a DOS image file (currently only SpartaDOS) and
spits out the corresponding directory structure under MSDOS

SCOPYDSK - converts a SpartaDOS "SCOPY" file to a SIO2PC disk image

I'll see about putting test copies up on ftp.kendall.mdcc.edu.

>for a while longer.

My initial reaction is that it probably makes a lot more sense to do the compression separate from the disk image format. I haven't tried it, but I suspect that even an ARC'd .ATR file would take less space than the equivalent .DCM, with a .ZIP file doing even better.

The problem is that people using only an Atari are hosed. You can't uncompress the .ATR file, since it's larger than your disk, so you need a modified decompression program that writes the .ATR file directly to the raw disk.

In the long run, I think this is a better way of doing it, but we need someone to hack a decompression program to deal with it.

263. Comments on an On-line Atari Magazine

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-09 00:00:00 UTC
From: RLCOLLI@IBM.NET
Message-ID: <igK2vksjYRjU083yn@IBM.NET>
Source record: 91035

After seeing the comments about Atari Classics a few weeks ago, I started thinking of starting an electronic Atari magazine. With the size of the Atari community, this is really the most economical way to support the Atari 8-bits. Here are my ideas so far:

Problem: What format to put it in?

- I was thinking of doing it in HTML, since there is a HTML viewer for about every operating system under the sun. The problem comes from people that exclusively use the 8-bits. So, a HTML viewer must be written. I know Bill K. has started on one, but I don't know how far along he has gotten with it. There would be two distributions of the magazine, one exclusively for the 8-bits, and one for everything else. The reason being I thought of this would be the fact that pictures can get big very fast, so with two versions you could put different formats of the pictures.

Problem: How to distribute it?

- I don't have access to a Web site to put it on, so I would just put it in the regular archives (umich and xmission).

Problem: Getting people to contribute.

- I don't have a good answer for this one, I'm just hoping there is enough people out there that would like to see an Atari specific magazine!!

Here are a few of the columns and features that I have thought of to include in the magazine:

Table of Contents:

Departments

-Editor's Memo
-Letters to the editor
-About Atari Memo Pad

Articles

Features

-Software Tips&Tricks
-Hardware Modifications
-What's New
-Atari Basic
-Action!

-Machine Language Tutorial

If anyone is interested in writing for these columns, or have other ideas for columns, let me know!!

I am very excited about this project, and the possibilities that electronic publishing has for the Atari 8bits!!

Any comments or suggestions?

Ryan 'Gozar' Collins rlcolli@ibm.net

SIO2PC plans are available at UMich in the "atari/8bit/Sio2pc" directory.
MyDOS 4.50 docs are available at UMich in the "atari/8bit/Os" directory,
along with MyDOS 4.50 in the same ARC. A small bootable disk image
version of MyDOS 4.53/4 was put there as well (the ARCd DCM is like 12K)
DCM2DSK2 for the PC is also at UMich, I think in the Sio2pc directory.
You may want to get DCMTOATR as well since it handles multi-part DCMs
in case you ever run across any.

UMich, as you probably know is:

ftp: atari.archive.umich.edu
amiga....
msdos...
gopher: gopher.archive.umich.edu under Merit Archives, Atari archives, 8bit

and you can e-mail it and get files UUencoded in the mail via BART, or
you can ftp to one of UMich's many mirror sites, for example:

ftp: wuarchive.wustl.edu under systems/atari/umich.edu/8bit

MyDOS is menu driven, if you are in BASIC, just type "DOS"<return> &
go from there. The SIO2PC cable only really does you any good if you
are willing to have a real Atari computer set up. People with an Atari
computer & at least one real drive have been using it for it's intended
purpose as well as porting files back & forth to use with the emulator
or just because their modem is on their clone. Anyway I don't think
there has been a public post of the 1 chip SIO2PC cable yet so with
one slight mod ('>') to his original file & my admonition to use pin
#4 logic ground instead of Nick's pin #6 shield ground.

Bill, you may want to consider any cheap ram expansion you can get. For instance, on an old Toshiba laptop I found a 1 meg memory expansion for $5 so I just use it as a ramdisk. I don't know if your PS/2 is only microchannel, but the old memory expansion boards can be had dirt cheap. I just added a 2 meg board to my clone that cost $15 for the board & I had that many 256k drams laying around. I've been offered these boards for 3megs/$40 fully populated. Figure the PS/2 is held in such low regard you can probably get parts dirt cheap. Just post a message to: ba.market.computers.forsale & I'm sure you'll find what you need.

Ivan, GIF would be the best since everyone can decode GIFs.
Also, if you can't FTP to "atari.archive.umich.edu"
~~~~~
then try FTPing to "amiga.archive.umich.edu" which I can get in 99% of the time
~~~~~
but be warned that the "cd" command:

(1) thinks you mean 'go to root', or "cd /" when you say "cd .."
(2) doesn't let you supply a full path like "cd atari/8bit/New",
you *must* do it one at a time: "cd atari", then "cd 8bit", then
"cd New"

(Remember, "binary" mode! hehe :))

Can't wait to see 'em!

Someone else is also working on a ATR2DCM program--The two of you
should probably coordinate your efforts. Talk to cmwagner@gate.net.

> DSK2FILE - reads a DOS image file (currently only SpartaDOS) and
> spits out the corresponding directory structure under MSDOS

I've done this for Unix and MyDOS images. See
ftp://ftp.cs.dartmouth.edu/pub/crow/Atari/atr2unix.c
It should compile for DOS with just a few changes.
The reverse program, unix2atr.c, is mostly done, but it doesn't write
the boot sectors or the bitmaps.

Ryan.. I'm game. I have a WWW home page as well, AND I'm willing to do
the following:

write viewer software for the Atari
write the Atari-format-to-HTML conversion for Unix
perhaps write viewer software for IBMs (in QBASIC)?

Although I think sticking to HTML 100% would be the easiest... BUT!!..
a few problems:
(1) People would have to conform to what my HTML viewer supports.. which
would, esp. in the beginning, not be much..
(2) Making a simple, HTMLish format (or an editor on the Atari) and THEN
an "HTMLish" viewer for the Atari and an "HTMLish-to-HTML" converter
would be very feasable, and of course, FUN! :)

btw, this is both posted and e-mailed..

get back to me.. i'm very interested!

274. Atari 8-bit Support From Richard Gore

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-09 00:00:00 UTC
From: CHMRIG@EAST-01.NOVELL.LEEDS.AC.UK
Message-ID: <4A9C0C7945@east-01.novell.leeds.ac.uk>
Source record: 91046

```
ATARI 8-BIT SUPPORT FROM RICHARD GORE
-------------------------------------

ARENA XL/XE 64K Disk only PRICE: #5 ($10)
----- The full 50 level version of the excellent puzzle game that
was a demo bonus on Page 6's issue 66 disk. You must guide
a set number of balls to the exit by strategically positioning pieces
of wall. Good graphics and very addictive.

BUBBLE ZONE XL/XE 64K Disk only PRICE: #5 ($10)
----------- A fast blast em set on a grid being invaded by expanding
bubbles. Collect the tokens and see how far you can
advance. Original gameplay and top notch graphics make
this a game of high quality.

JAWBREAKER 16K Disk, Tape, Rambit Turbo tape PRICE: #4 ($8)
---------- Classic maze game based on Pac-Man, munch the sweets but
don't forget that important dental hygiene! Two
different mazes are supplied which were originally sold as separate
games for nearly $30 each on release. Double the value and a bargain
price as well.

MOUSEKATTACK 48K Disk, Tape, Rambit Turbo tape PRICE: #4 ($8)
------------ Another classic maze game, but this one involves you
plumbing the levels of Rat Alley. Addictive arcade
action with a simultaneous two player option.

MAZE GAMES OFFER: Buy both Jawbreaker and Mousekattack in one pack
^^^^^^^^^^^^^^^^ for the bargain price of #6.95 ($14)!!!!

TUBE BADDIES 64K XL/XE only, disk only PRICE: #4.95 ($11)
------------ Tube Baddies is an arcade, strategy type game. The
Tubular Underworld is being attacked by Tube Baddies,
you must stun these baddies, and then bounce them off the walls into
the collection bucket before the Inspector arrives. The graphics and
sounds are top class and the gameplay is great even if it is hard to
describe. Tube Baddies was to be launched by Atari UK several years
ago, but they changed their mind, but now its available at last!

BLACK LAMP 64K XL/XE only, disk only PRICE: #4.95 ($11)
---------- This is a wondeful gothic arcade platform adventure. As
Jolly Jack the Jester you must collect the Lamps in
order to restore peace to Allegoria. Excellent music and fx and some
of the best graphics ever seen on an 8-bit Atari game couple with good
gameplay and a genuine aim to make this a must for your collection.
```

SPECIAL LAUNCH OFFER: Buy both Tube Baddies and Black Lamp for only
^^^^^^^^^^^^^^^^^^^^ #9.50 ($20).

GTRACKER XL/XE 64K Disk only PRICE: #6.50 ($14)
-------- A new sequencer program for Replay (or Parrot) compatible
digitised sound samples. You can construct your own digi-
tunes using your own samples. Supplied with several sample tunes, a
player program, 6 page manual and a free PD demo disk showing just
what can be achieved. Now also supports stereo editing of mono
samples, ie you can play your mono sample on either the left or right
channel or even on both channels simultaneously and switch between
channels at will. Playback via the separate Player program (supplied)
is as you designated when you edited your 'digi-tune'. Of course you
need a suitable upgraded stereo (Gumby compatible) machine to take
advantage of the stereo features. Compatible with mono machines, all
the sounds will come from just the one speaker.
We will also be releasing extra tune data disks in the future as well
as new utilities and a XE version using the extra banked memory.
Updates, where desired, will be available on receipt of your master
disk and for the price of return postage and packing.

SUPER PRINT LAB XE XL/XE 128K Disk only PRICE: #6.95 ($15)
------------------ A new monochrome design and print program
developed for 128k (130XE type memory) users.
Features include the usual arrary of drawing tools as well as programs
to create icons, split a screen, mix 2 screens and a mini database for
creating labels. Printer support is included for Atari 1029, Epson
compatibles and the Atari 1020 in upto 4 colours!! Yorky compatible.

YORKY 256K MEMORY UPGRADE

A 256k memory upgrade that simply plugs into the PBI port of your
800XL (or internal 64k 600XL). NO soldering is required. Supplied
ready to plug in and use with all the necessary RAM chips, the manual
and a disk of support software.
VERY FEW UNITS LEFT. THIS COULD BE YOUR LAST CHANCE TO OBTAIN ONE.

PRICE: #50 +p&p (UK #2, EC #3.50, WORLD #5) or $90 complete.

I also have limited stocks of the following commercial software items.
The software items below are brand new, in their original packaging,
with English manual(s) and most are still shrink wrapped. You are
advised to check availability before ordering.

Halley Patrol (disk) #3.00 ($6) Antic educational software.
Summer Games (disk) #5.00 ($10) great olympics sports action.
Solar Star (disk) #5.00 ($10) also known as Sun Star!

ONE ONLY: Gauntlet Deeper Dungeons (disk)- Mindscape version #2 ($4)
-------- Miner 2049er (rom)- no box or docs #2 ($4)
Desert Falcon (rom)- sealed brand new #6 ($14)
Dropzone (disk)- sealed brand new #5 ($10)
These items are offered on a first come first served basis.

E-mail me to reserve anything you might want.

All software prices include postage and packing to UK addresses,
overseas please add #2 per order. Prices in US$ include shipping but
payment must be made in US$ cash (notes only please - no coins).
UK pounds are accepted in cash, cheque (made payable to Richard Gore),
IMO or postal order. From within Europe Eurocheques are acceptable.

>want to do the CSS fix where you have to upgrade the drive as well. Doesn't
>the CSS fix fix this problem and upgrade it to a 3.5" drive, but can it write
>720K or is it still 360K?

The density switching bug can hit harder with other DOSes. With any DOS other
than Sparta, you will boot cleanly into DD and you can switch from DD to ED or
SD... however, when you are in SD or ED and attempt to go to DD by reading
a directory or file the drive will "lock up". You can access SD again to
"reset" things, but to go back to DD you have to issue a command from either
BASIC or use the DOS density switching routines (if your DOS supports that).

SpartaDOS -will- switch cleanly between any density AS LONG AS THE DISK IS IN
SPARTA FORMAT. If the disk is standard Atari DOS format, you'll have the same
problem as with any other DOS. The "Error: No DOS" you are getting has a
software fix. There is a BASIC patch program that will take care of this
little "problem" with SpartaDOS 3.2d and 3.2f. You loose automatic drive
sensing (you have to tell the program what you have & where), but that is
no big deal if you always use the same drive configuration on your system.
The patch works very well... I use it all the time... It also makes a new copy
of XINIT that will write the boot sectors to avoid the problem with future
disks (and you can non-destructivly fix your existing boot disks).

The CSS fix is a new ROM for the drive (and other stuff as well). It fixes
the problem with -any- DOS. You can keep your existing 5 1/4" mech or upgrade
to a 3 1/2 720K mech with an add-on option. A second option allows you to
keep your 5 1/4" mech and -add- a 3 1/2" mech to the drive... 2 drives in 1!
I don't have these, but they sound interesting.

No big thing, but I thought I might run that bench mark that showed
an IBM PC finishing it in about 5.5 seconds & Atari comming in at
9+seconds. So I ran it with my fast FP ROM, 2.96 seconds with the
screen on, 2.03 with it off. But... the new FP routines are not that
much faster. So with the original routines, 3.3 & 2.25 respectively.
Not a really big thing, but unless there was something about running
3 iterations in the article, it seems a little screwy.
To be fair, it seems like my old 7 & change MHz Tandy sort of 286 will
do it for a seed of 1500 rather then 150 in 6 seconds. This translates
to about an equivalent of 2.4 seconds on a PC, but since it looks like
a bubble sort, it's supposed to be much slower as the size of the array
increases, but these times seem all out of wack. I have a math coprocessor
in the Tandy, but my 80C88/10 MHz laptop seems to turn in a lot quicker
of times then could be explained by just clock speed & I'm pretty
sure it doesn't have a coprocessor. The basic ratios of speed are right,
but the actual times are screwy.
Rick

277. Re: 65C02,65C816,DMA CTRL,and RGB monitor?

Newsgroup: comp.sys.atari.8bit

From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <ZU1edBJ.lmcclure@delphi.com>
Source record: 91049

In a message dated 6-8-95, xebec@delphi.com said:

"I am fed up of poor quality of xl video output, does
anybody have the pinout on gtia to get rgb signals to
use my sony 15sf S-vga monitor?"

The GTIA chip does not output RGB signals. At present, the only RGB mod for the Atari 8-bit taps into the the luma level output at a point where they exist in digital form, and uses those to drive an RGBI monitor (which could be converted for use with an RGB analog monitor). While fine for text, the result with games and graphics programs would be rather strange, as different luma levels translate to different colors (i.e, if you had a display of that used 8 shades of the same color, this RGB mod would give you 8 different colors instead).

Another approach would be to build an NTSC-to-RGB convertor, similar to the one detailed in an issue of Radio-Electronics many moons ago.

One could also purchase a device with similar transcoding capabilities and hack it for use. I purchased an old Amiga 1300 genlock (the one Commodore sold for the A1000) for just such a purpose, but have not had the time to hack a separate power supply for it. (Unlike most genlocks, this one output the combined graphics to not only the composite output, but the RGB monitor output as well. When set to "source only" mode, it simply translated the external composite input to RGB).

Another method would be to use the RGBI mod mentioned in my first paragraph, and add a 16-palette RAMDAC. The only problem with this would be hacking the RAMDAC into the A-8's address space, but one could not doubt follow the approach used for adding additional PIA's. With this, the output would be directly compatible with RGB analog monitors, and the colors could be selected from a palette of 4096, allowing them to more accurately match those from the composite output, or be changed to something totally different when desired. The last time I brought this issue up, exactly zero interest was expressed, however.

If you have access to a split video monitor (such as a Commodore 1701, 1702, 1802, 1902, 1080, 1084), or a TV/monitor with S-video, the SuperVideo 2.1XL mod detailed in the December 1993 issue of Atari Classics would no doubt be the best approach.

Howdy David

Addresses are always welcome here.

Please do release new software. I like the idea of using my classic Atari to
I.R. controle all kinds of stuff (especially if it's cheap).

Please release the ASCII version of the schematics. I was lucky, I know
somebody at NedCar (the company that builds Volvo 440, 460, 480's and
Mitsubishi's in the Netherlands).

CU Mathy Van Nisselroy mathniss@link.xs4all.nl

I found a supplier overhere in the Netherlands for the piece of hardware
that is described above, but they don't sell under 1000 (yep, one thousend)
pieces.

290. Flickerterm-R:handlers for the 1030 modem

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-10 00:00:00 UTC
From: ac393@detroit.freenet.org
Message-ID: <3rdb4g$fp0@detroit.freenet.org>
Source record: 90867

I'd like to know if anyone has been sucessful with using Flickerterm using an Atari 1030 modem. If you have been sucessful,what R:handler did you use and did you load it separately or append FLICK80.COM to it as part of a AUTORUN.SYS file? The trouble I'm having is that the 1030 won't initialize. I've tried the different R:handlers available on the FTP sites,and a couple that I had already,but either I couldn't get Flickerterm to run,or if I got the Flickerterm screen,it doesn't seem like it's seeing the modem. I've downloaded thee program twice,the last time I downloaded it uudecoded to see if it would be any different-I got the same results. Any Suggestions?

AHH! Rich! With BASIC INSTALLED!? BLEAHRG! :)

My poor 1200XL+256K+800XLOS had BASIC removed and a special 800XLOS which Mr. Woolley burned which let me reboot with Ctrl+F4.. man, I got used to that.. now it's "Hold [RESET], Pull out the Action! cart, let go, hold [RESET] again, stick the cart in, and hope my 192K RAMdisk didn't get trashed (which 50% of the time it does! >:^( )"

Oh yeah! And in place of BASIC it had an 800 OS.. the switch between them was the RF-out channel switch (i used monitor ports so I didnt need RF aymore)

ATARI 8-BIT HARDWARE FOR SALE:

PS=Power Supply.

NEC Color Monitor with Audio/Video/
In & Out RCA Jacks.........$75 U.S.

Comrex Composite Color Monitor w/
Audio/Video/In RCA Jacks....$60 U.S.

NEC Green Screen Monitor with Audio/
Video/In & Out RCA Jacks....$40 U.S.

N.A.P./Magnavox Amber Monitor with
Audio/Video/In RCA Jacks....$25 U.S.

USI MonoChrome/Amber Video Monitor,
Industrial Grade............$25 U.S.

Atari 130xe, 320K w/ Special PS &
Manual.....................$100 U.S.

Atari 800xl, 64K
w/ Special PS..............$75 U.S.

Atari 800xl, 64k
w/PS.......................$50 U.S.

Atari 800xl, 64k
w/o PS.....................$40 U.S.

Atari 800, 48K
w/o PS.....................$25 U.S.

Atari 400, ??K
w/o PS, Good for Games......$10 U.S.

Atari xf551 Disk Drive, DS/DD, New
w/Box, Manual, Dos, PS.....$150 U.S.

Atari xf551 Disk Drive, DS/DD, New
Drive Only, w/o PS.........$100 U.S.

Atari 1050 Disk Drive, SS/DD, w/PS,
U.S. Doubler, DOS, Sector Copier
& SIO Cable................$75 U.S.

Atari 1050 Disk Drive, SS/ED, w/PS,
DOS, Manual & SIO Cable.....$60 U.S.
```

Atari 1050 Disk Drive, SS/ED, w/PS,
DOS, & SIO Cable.....$50 U.S.

Atari 1050 Disk Drive, SS/ED
w/o PS.....$40 U.S.

Atari 810 Happy Disk Drive, SS/SD
Excellent for Disk Copying. With/PS,
Manual & Happy SoftWare.....$50 U.S.

Atari 810 Disk Drive, SS/SD
w/PS.....$30 U.S.

Animation Station, Suncom Design Pad
& Graphics & Text Processor SoftWare
(Design Lab), Never Opened..$35 U.S.

Koala Pad with Micro Illustrator
SoftWare on Disk.....$25 U.S.

Atari 1020 Plotter (Color Printer)
Direct Connect, w/o PS.....$20 U.S.

Atari 1025 Dot Matrix 80 Column
Direct Connect Printer. Uses Type
Writer Ribbon. Built in PS..$30 U.S.

Atari 850 Interface
Lets your Atari use standard modems
and Printers, Bare 850.....$25 U.S.
add Power Supply for.....$15 U.S.
add SIO Cable for.....$5 U.S.
add Printer or MoDeM cable..$10 Each
add Manuals, $5 each, all 3.$15 U.S.
Buy a complete 850 with all above.
Complete for.....$75 U.S.

ICD Direct Connect SIO to Printer
Interface, 10 foot Long Cable.
No PS Needed.....$30 U.S.

MPP Direct Connect SIO to Printer
Interface, No PS Needed.....$25 U.S.

MPP-1100 Printer InterFace
No PS Needed, Plugs into Joystick
Port, "as is" no Docs or driver disk
.....$10 U.S.

MPP-1150 Direct Connect SIO to
Printer Interface, No PS Needed.
With Pass through Port and Docs.
.....$40 U.S.

Star Micronics Direct Connect SIO to
Printer Interface, No PS Needed.
.....$25 U.S.

Atari CX85 Numeric KeyPad
Plugs into Jostick Port......$8 U.S.

Atari XM301 modem, 300bps
Direct Connect, needs no PS..$8 U.S.

Atari 1010 Program Recorder
Cassette Storage, w/o PS.....$5 U.S.

Atari 410 Program Recorder
Uses standard cassette tapes
w/Built In PS.....$5 U.S.

JoySticks, makes/models
E-Mail or Call Voice for more info.
Starting at only .....$5 U.S.

300. 256K 600XL

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-10 00:00:00 UTC
From: b.poehland@genie.geis.com
Message-ID: <199506110346.AA150092365@relay1.geis.com>
Source record: 90877

Mathy van Nisselroy's response to my earlier post on the 256K 600XL suggests he's either missed some mail or his mail is much delayed.

Mathy, in subsequent postings I pretty much got all the bugs cleaned up & got my 256K 600XL (which I named "THunder Child") working reliably. The main culprit was a weak CPU that crapped out when it tried to drive the extra memory. You mentioned something about "Mexican-made" CPU chips that you seem to have some negative experience with, but my experience suggests the country of origin of the chip is probably irrelevant. I believe the brand name on the chip is a more reliable indicator of how trustworthy it is. Chips made by IMP & by Rockwell seem to be most reliable. The ones I had several failures with were all made by Synertek (which went out of business some years ago).

The reason I say the country of origin is irrelevant is bacause most semiconductor companies have plants scattered all over the world. Third-world countries like Mexico, Singapore, Malaysia, Philippines, & Hong Kong seem the most popular. Regardless of the location of the actual plant, however, the chip produced (& the QC standards) are always set by the parent company, so that chips produced by the same company under the same brand name from plants in different locations around the world are all identical.

Well, theoretically anyway! :)

As a final note to my most recent "Update/Review" of Thunder Child, I had another thought concerning the DRAM stack thermal overload problem. I've noticed that older/slower DRAMs (200nS & 150nS units) seem to run hotter than newer/faster units (120nS & faster). I used 150nS DRAMs. I now wish I'd used 120's or 100's, which usually run cooler, & maybe the thing would have worked OK from the very beginning. (Except for the bad CPU, of course.) Well, kinda academic now, after three shots at it & with a machine that does at least work, I'm not about to rip it up & hack it again. After so much soldering/desoldering, the circuit board isn't exactly in the best shape anymore.

- Ben Poehland

301. FS: Classic Atari Books: Catalog!

I have the following computer books
for sale, most are for the Atari
8-Bit line of computers.

Title; Author; Publisher; Description;
Price

6502 Assembly Language Subroutines;
Lance A. Leventhal & Winthrop
Saville; Osborne/McGraw Hill; Source
& Reference for Assembly Language
Routines;.....$5.00 U.S.

Advanced ATARI BASIC Tutorial; Robert
A. Peck; Computer Direct;...$7.50 U.S.

An Invitation to Programming 2:;
Atari; SoftWare Manual for Writing
Programs;.....$5.00 U.S.

Atari 400/800 DiskGuide; John Taylor &
David A. Wilson; Osborne/McGraw-Hill;
.....$5.00 U.S.

The Atari Assembler; Don Inman & Kurt
Inman; Reston Publishing; Reference
for the Atari Assembler Cartridge;
.....$3.00 U.S.

Atari Basic; Bob Albrecht, LeRoy
Finkel & Jerald R. Brown; John Wiley &
Son.; Basic Referen/Minus front Cover;
.....$3.00 U.S.

Atari Basic; Bob Albrecht, LeRoy
Finkel & Jerald R. Brown; John Wiley &
Son.; Basic Reference;.....$5.00 U.S.

Atari Basic Reference Guide; Atari;
Quick Reference for Atari Basic.;
.....$7.50 U.S.

Atari Graphics and Arcade Game Design;
Jeffrey Stanton with Dan Pinal; Arrays
Inc.;.....$7.50 U.S.

Atari Microsoft Basic Instruction
Manual; Atari; PhotoCopied and Bound

Manual;.....$5.00 U.S.

Atari Sound and Graphics; Herb Moore, Judy Lower, Bob Albrecht; Self Teaching Guide;.....$5.00 U.S.

Atari User's Guide; Mark Ellis, Robert Ellis & Larry Joel Goldstein; Brady Communicat Basic & Graphics for Atari 400/800/600XL/800XL/1200XL;$10.00 U.S.

Basic Atari Basic; James S. Coan & Richard Kushner; Hayden Book Comp Atari Basic Book for the 400, 800 and the XL Computers;.....$5.00 U.S.

Beyond Games. Systems SoftWare for your 6502 Personal Computer; Ken Skier; Byte Publishing;.....$7.50 U.S.

Bits, Bytes and Buzzwords; Mark Garetz; dilithium Press; Understanding Small Business Computers;...$5.00 U.S.

COMPUTE!'S FIRST BOOK OF ATARI GAMES; COMPUTE! Books; Type in Game Listings with info on Developing your own Games!;.....$5.00 U.S.

302. Thunder Child

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-10 00:00:00 UTC
From: b.poehland@genie.geis.com
Message-ID: <199506110430.AA194265022@relay1.geis.com>
Source record: 90879

Kit Kimes described a 256K upgrade he & a friend did at Bell Labs, which ran fine for hours at a time but only accessed 192K of the available 256K.

I would say Thunder Child is probably performing at least as well as Kit's machine, maybe better. The Child accesses all 256K of its available memory with no problem & does not use a custom PAL or re-burned MMU or OS. It also runs fine for hours at a time, which is why I'm using it in the system I keep set up for burning EPROMs.

It is when running for *DAYS* at a time, using a BASIC routine I wrote that continuously accesses the extra RAM, that problems crop up. This is a *very* severe test.

Also, I suspect Kit never connected his 256K 600XL to a Black Box/Floppy Board with a 44-meg hard drive & four 1.44-meg floppies on the PBI plus an XEP80 drawing power (0.5 amperes) from the joystick port, with a 360K XF551 & 720K slave on the SIO. That kind of load on the supply & signal busses is a formidible environment (I had one XE that gave up the ghost with all this junk attached). Thunder Child lasted maybe 1-2 hours under that stress before the heat buildup started affecting its performance. Much of the problem is just the fact that everything is so darned congested in there!

I probably demad a great deal more reliability from my equipment than folks who just boot up their machine to play an occasional videogame. I often frget the clock when I get going on stuff, so 6-hours sessions are not unusual. I must confess even my 1-meg 800XL "Behemoth" gets testy after a straight 5 hours during July & August. (During the rest of the year it performs perfectly regardless of the how long I leave it on, sometimes for 3 or 4 days at a time).

But when it comes to video performance, I betcha my Child will blow Kit's machine into the dust. Your machine got Super Video, Kit? If not, buy the Dec '93 issues of AC from Bob Woolley & do it. You'll like it!
I wouldn't consider *any* RAM upgrade for a 600XL unless the video was first brought up to snuff. (And I don't mean Jeff Popp's crummy 600XL video upgrade, either. He just tells you to install the same shitty parts that are shown on Atari's schematics. Super Video cleans up all the mistakes that are on the schematics!)

Cute little critter, tho, ain't it? An upgraded 600XL is the real "sleeper" in the entire XL line! Heck, peple throw them away! <cringe!>

- Ben Poehland

303. Thunder Child Update/Review

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-10 00:00:00 UTC
From: b.poehland@genie.geis.com
Message-ID: <199506110447.AA204406071@relay1.geis.com>

RE: the dicsussion between Kit Kimes & Jim King concerning memory allocation in the 256K 600XL, I'd just like to comment how I'm running mine.

I use the PSI RAMdisk utility distributed on one of the AC Software disks a year or two ago. I *really* like that thing! It will supposedly format RAM up to 2.5-megs in any XL/XE machine. I use it routinely with my 1-meg 800XL.

In my SpartaDOS 3.2d STARTUP.BAT file for Thunder Child, I configure it so that the lower 128K is set aside as system memory, which allows me to run all the usual 64K software plus the handfull of programs that use the extra 64K in the 130XE (such as the XE version of AtariWriter-80). The remaining 128K is set up as a 128K RAMdisk designated D8:. I pretty much use this setup for all my machines, execept of course the D8: RAMdisk in Behemoth is a lot larger, like 960K. Plenty of room for downloading stuff into the RAMdisk! :)

: I don't think I have the software any more but if anyone is interested in
: these, I'll try and dig it up.

: For sale at B.O.

: If interested, send me mail at bob@os9.jriver.com

: Thanks.

: On an unrelated question, I saw the percom and 720k disk articles and am
: wondering what version of atari DOS lets you access 720k??

I use TopDos Professional by Richard K. Bennett. It is advertised to
handle up to 65536 sectors. I use it on an XF551 (360 K) and some
double density 1050s very successfully. One of my daughters uses it on a
Percom (only double density, though). It has good ramdisk capability
too. I generally just leave my computer (a 320k 130 XE) on all the time
with a 256 K ramdisk active. I turn off the other disks and only bring
'em back when I need them. I rarely boot anymore.

Hi there;
I am fairly new to programming in assembly lang and I can't
figure ouy what's wromg with the program. The program does what it is
suppose to do but it goes in an endless loop!

What it does is read from the command line in sprtados and send
the command to sio2pc through disk #9.

(Compiled using kasm)

```
ORG $3000

COMTAB = 10

DSKINV = $E453

DDEVIC = $0300
DUNIT = $0301
DCOMND = $0302
DSTATS = $0303
DBUFLO = $0304
DBUFHI = $0305

;initilize x and y

LDX #0
LDY #63

;read in command string

STRIP LDA (COMTAB),Y
INY
CMP #32
BNE STRIP

LOAD LDA (COMTAB),Y
STA $0600,X
INX
INY
CMP #155
BNE LOAD
DEX
LDA #32
STA $0600,X
INX
LDA #155
STA $0600,X
```

```
;now send it to drive 9
;the sio2pc special drive

LDA #$57 ;WRITE
STA DCOMND
LDA #$80
STA DSTATS
LDA #9
STA DUNIT
LDA #$06
STA DBUFHI
LDA #$00
STA DBUFLO
JSR DSKINV ;Run It
RTS

END $3000
```

Thanks for any help you can offer....

```

But people with just Ataris can't unzip ATR files, and put them on a
real disk. That's what the gripe is.

I have two 1050s which work fine (ijust have far too many of them!) and
3 800XLs which I would like to sell and/or trade. Make me an offer!

I am looking for some of the following stuff:

Happy Enhancement
Atari Touch Tablet
8-bit carts

I also have a Happy Board with docs and software which for one reason or
another does not work. Can anyone fix this?

Thanks!

The 1200XL is very easy to upgrade to a 1200XE if you can use a soldering iron. The hack is from the Bob Woolley article. I just did 2 of them and tonight delivered them to Video 61. He supplied the parts from 2 junked 600XL's. These two I was lucky on. They both had 28 pin sockets already installed. Took 15 minutes each once I had them apart.
Fully 800XL/XE compatible, with built in BASIC and all the function keys still work.
Rich Mier

312. And another thing<g>

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-10 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <140202@cup.portal.com>
Source record: 90889

OK, another warning about I may be telling you more then you want
to know. Anyway, I promised I'd do some Action! code to see if we
could figure out just exactly how SDX launches a program.
First I just did a little piece of code:

```
define TSX="$BA",
STX="$8E"
Proc Test()
Byte a
[ TSX
STX a ]
PrintBE(a)
Return
```

Now this little gem produces 243 when run from the Action! monitor,
but when compiled, saved to D9: as TEST.COM, then run from the SDX
command line with:

```
CAR I:TEST
```

It prints out:
230
247
The imfamous double run, but 17 deep for the stack on the first
pass?!?!?!? Actually it's only 13 deeper then the monitor version, but
what seems odd to me is the stack ISN'T pushed in multiples of TWO!
No wonder people had some trouble cleaning up the stack for a clean
return to DOS.
Next I made a couple of compound files by copying the same file end to
end. i.e. COPY TEST.COM BIGTEST.COM/A three times. When I ran this
puppy I got:
230
230
230
247
3 INIT vectors followed by the SDX wild run. Just what you'd expect.
So now I go into a sector editor & patch the $2E2-$2E3 INIT vector to
be $2E0-$2E1 RUN vectors. BIGTEST just had the last INIT vector
changed.
CAR TEST gave
247
CAR BIGTEST gave
230
230
247

Perfect! This is the way it's supposed to work. Now the only sad news is the new Action! carts only use the RUN vector vs INIT so let's say you wanted to create a terminal program in Action! that instead of exiting to DOS when you finished loaded up a word processor so you could read/respond to your mail. Can't do it anymore! Well you could, but if it's with a new Action! cart you'd have to change the vectors to INIT for all but the last file similar to what I just did. Anyway I always thought it was kind of neat to have a 64k computer that could run a program as big as you had storage for. I'm going to have to read up a little more on INIT vectors, I want to make sure they close the channel they were loaded from before the file is INIT. Well, on to Micro Illustrator compressed disk!

313. More stack stuff

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-10 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <140203@cup.portal.com>
Source record: 90890

Well, I had to fool with it a little more, turns out that the stack drops lower in memory everytime you go from the Editor to the Monitor in Action! That's the reason why I saw such a low stack. If you press <RESET> from the monitor & compile/run the code, you get 249 for the stack pointer. It drops 4 bytes on every switch. If you were to do 60 compiles/edits without pressing reset or returning to DOS it could result in heart break city. Mildly anoying bug, but 90% of the code I write requires me to push the reset button on a regular basis anyway, at least when I'm not cycling the power on & off. So fair warning to any genius out there using Action! that can go through 60 cycles of compile/edit without a crash. The thing may crash on you anyway.
Rick

314. TRADE printers for Atari-8 stuff

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-10 00:00:00 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <hyyf9nA.lmcclure@delphi.com>
Source record: 91051

Now that I have a laser printer in the house, my three dot matrix printers are sitting idle, so it is time to trade them for something I will use.

Originally, I was looking to trade one or more of them for an external CD-ROM drive, but as there has been no response, I have decided to expand my list of items I will accept in trade:

Here is what I am offering in trade:

Printer Model	Approx. Cash Value
Panasonic 1091i	$70
Star NX-1000 Rainbow (color)	$75
Citizen GSX-140 (w/ color kit)	$170

Most of you are likely familiar with the Panasonic and Star models mentioned. Both are 9-pin printers. The Citizen is a very nice 24-pin printer, with loads of features including a LCD menu display, loadable macros, reconfigurable push/pull tractor, etc. If I were going to keep any of these printers, it would definitely be this one.

All these printers are in very good condition, and include original manuals and boxes (although the Star's box is missing the styrofoam packing blocks).

ITEMS WANTED IN TRADE:

(1) For the Panasonic 1091i or Star NX-1000R:

* CSS Ultraspeed+ OS + <$12 cash
* CSS XF single (3.5" drive) upgrade (including 3.5" mech)
* FTe Sweet 16
* Newell or ICD RAMbo upgrade + <$40 cash (less if includes RAM)
* Quantum LPS120S drive mechanism (or LPS105S + <$25)
* External 14.4Kbps data/fax modem
* Set of four 1meg 2-chip or 3-chip SIMMs, 100ns or faster

(2) For Citizen GSX-140:

* CSS Black Box
* ICD MIO (preference given to 1 meg) + small 3.5" Seagate SCSI mech
* External V.34 (28.8Kbps) modem
* Quantum LPS240S + <$30 or larger Quantum drive
* 540meg or larger 3.5" IDE low profile (1" high) drive
* Any two of the items listed under (1) + <$25 cash (or one + <$95)

Naturally, I am not averse to cash-only offers, either. <grin>

If you have something not listed that you think I might be interested in, make the offer...the worst I can say is "No thanks".

If you have an item you want to trade but think it is worth more than the printer you want to trade it for (i.e., a Quantum LPS240S for the Panasonic or Star, or you have an CSS Black Box + Floppy Board to trade for the Citizen), let me know how much extra you would want from me.

Okay, so would there be any interest in a program, or a commercial (say, $5 a disk) service for converting Atari floppies to emulator-compatible "disk image" files? I've been meaning to write the program, but haven't because I don't have anyplace to write the "disk image files" (no HD on my Atari); a buddy of mine has the HDs but not the programming know-how. How many of YOU would be willing to outlay a few bucks to work around all the apparent problems with trying to do this conversion yourself?

Guess converting C-128 to 130XE code wouldn't be easy, would it? Maybe some of you programmers could come up with a decent fax-utility for the classic Atari. If it can be done for the C128, it should be doable for our computer too, or....

M >
M >Dave
M >David Wyn Davies

Yes :-)

Why not make a small device, that will enable us to place those PBI devices
where we want them. As in, a couple of feet away from the PBI. Using a
non-flat cable (the round stuff, like SIO and joystick cables, but with more
wires inside).

I guess you need a power supply for both the 800XL and 1050?

Okay...

#A2534 XL/XE and XEGS POWER SUPPLY $9.95
#A210 FACTORY REPLACEMENT POWER PACK (1050) $4.00

These look like they are the correct prices, call American Techna-Vision at
510-351-3787. And those are the part numbers.

And your IO cables...

#A216D SERIAL I/O CABLE $1.50 or 10 for $10.00

It wasn't all that great. I picked-up a copy at the Dallas AtariFest in 1987. Disappointingly, there weren't any ML programs. I typed in a few of the BASIC games and they were the typical, barely playable, BASIC game fare. There weren't any pictures, so it was hard to figure out what the programs were like before you typed them in. There might have been something good in there, I guess, but I didn't have the incentive to try and find it.

>The hack to replace it is easy-peasy, however.. I believe.. if the thing's
>socketed for the right CPU (or something.. I know there's some
#-of-pins-on-
>the-CPU-chip difference or something between the 800XL and the 1200XL..)

Close. The 1200XL ROMS are 24 pin, the 800XL are 28, but the 1200XL's
motherboard has the traces on it for the 28 pin sockets, so you swap in a 28
pin socket and your almost there. One more address line (A13) is needed.
Just remove the W6 jumper and solder a jumper from the pin 23 of the CPU
(U21) to the TOP pad of W6 and plug in the 800XL rom. You also have to swap
in an 800XL MMU chip (U14 same number of pins as the 1200XL) and pull out
all the jumpers except W11,W12,& W9.
If you want basic on board you plug a basic rom (28 pin again so the same
steps apply as above for the socket) into U12 with pins 24&21 bent up.
Solder a jumper from pin 24 to +5v to the top of C11 (just to the left of
U13), from pin 21 to the LEFT hand pad of W7 and the last jumper is from pin
18 of U14 to pin 11 of U23. You now have internal basic.
>
>Bob Woolley would of course know EVERYthing you'd ever want to know about

Source record: 90897

---------==================================----------

Update On The PAL/NTSC Demo At the Upcoming Long Island NEAR*US AtariMeet

----------====================================----------

Last week Nir Dary mailed me his PAL/NTSC-upgraded 130XE to demonstrate at the upcoming NEAR*US AtariMeet on Long Island NY on June 17. At first things didn't go too well, the machine arrived broken (eeek!). However I soon put things right & commenced giving Nir's PAL upgrade a long hard look. I'm happy to say that it pretty much performs as advertised, so I am *definitely* going to bring it to the June 17 show & demo it.

Nir also included some PAL demo software for me to use. Unfortunately most of that material I found not very useable for a variety of reasons (the Sweet Illusions Demo appeared to run great but the darn disk has a defective sector on it-- arrgggh!). But there was one disk in there that just blew me away, & I will SURELY use this for the demo!

This is a new Polish game called "T-34". OUTTA SIGHT!!! The title is based on the famous Russian T-34 tank, & the game is basically a "blast the other guy's tank before he blasts yours" theme. But THE GRAPHICS!!! Omigod, I'm still phreaking out over it. These guys used FULL 128K XE memory for the graphics, & I'm here to tellyah it's a TRIP! If you live anywhere within 150 miles of Long Island, you should drop in & see this thing. You *must* have Nir's PAL/NTSC upgrade to run it, it won't run on an NTSC machine (I tried, it crashed). Nir also told me he has just received his first shipment of 20 PAL ANTIC chips with 50 more on the way. Things are cooking out there in CA!

Now peoples, those of you who know me also know I have rather a dour attitude toward videogames. There are maybe 2 or 3 I like, I don't give a hoot for all the rest. So note carefully here, I am *RAVING* about a videogame! (I hope Nir will let me keep it!) It is my opinion that it would be worthwhile to buy Nir's PAL upgrade just so you could run this one program. YES, it is that impressive! So... come to the June 17 AtariMeet & let me show you this thing!

- Ben Poehland

----------======================================----------

June 11, 1995

Fellow Atarians!

Get a pencil and mark your calendars! Grab a phone and call your friends! On June 17th, 1995, NEAR*US will be having an AtariMeet on Long Island!

What's an AtariMeet? Well, it's a get-together with other Atarians from around the NorthEast. It's informal with guest speakers, demos, and Atari goodies to buy, sell & trade. It's where to meet people interested in Atari computers and related products. It's a place to make friends with common interests. It's a place to share information, tips and techniques. Best of all, attendance is FREE!

Our main speaker will be from Wizztronics. Wizztronics continues to support the Atari community with many products like CartMaster, Compatibility Plus, Deka 2 Keyboard interface, and the Falcon Rack. They have brand new products including the Barracuda 040 Accelerator for the Falcon 030 and are continuing work on a several new and exciting projects. This is your chance to find out all the latest, right from the source!

At this time, several other notable Atari developers/vendors have expressed serious interest in attending. They represent both 8-bit and ST areas. Some have not committed as of this date, but Nir Dary of OHAUG has shipped his PAL-upgraded 130XE to Ben Poehland in Pennsylvania. Ben will demonstrate this latest 8-bit upgrade which permits North American 8-bits to run European PAL software without compromising the ability to run NTSC software as well.

There will be tables available for vendors, developers & users wishing to sell and trade Atari related items. Reservations for tables are required, and a small donation for tables is requested to help offset costs. If you are interested in reserving a table, please contact me ASAP!

If you are a vendor or developer of any Atari related products and would like to address the group and/or demo your products, there is time to make your plans right up to the day of the AtariMeet! We want to meet you and will be keeping this AtariMeet as informal as practical to accommodate all interested parties.

During the last 8 months, NEAR*US meetings have drawn Atarians from Connecticut, Massachusetts, New Jersey, New York, and Pennsylvania. Atarians using many different platforms and with varied backgrounds and skill levels found many common interests, but all with a need for support! Finding support is what NEAR*US is about!

Jonathan C. Mordosky
NEAR*US Interim Chairman

If you need further information, would like to reserve a vender table, or represent a Atari supporting company and would like to address NEAR*US, please feel free to contact me at the following:

on GEnie: J.C.MORDOSKY
on the Internet J.C.MORDOSKY@genie.geis.com
on the IAN & NEAR*US Nets: Jonathan Mordosky
on ACUTE BBS (610) 261-0620: Feedback to SysOp
via US Mail: Jonathan C. Mordosky

P.O. Box 796
Whitehall, PA 18052-0796

What is NEAR*US?

NEAR*US is an association of 8/16/32/64 bit Atari users. It is in a continuing process of reformation. It is non-profit and self-funded. It is not affiliated with Atari Corporation, its subsidiaries or any commercial enterprise. We do not support piracy either directly or implied, or the use of computers for any illegal activity. A short history and more information about past meetings can be found on GEnie and many BBSes.

NEAR*US AtariMeet

Saturday, June 17, 1995 - 12:00 AM to 5:00 PM

Admission is FREE!

Plainview-Old Bethpage Library
999 Old Country Road
Plainview, New York USA

The Plainview-Old Bethpage Library is located in the middle of western Long Island in New York. It is located on a major roadway and is easily accessible from major highways.

Directions from the Long Island Expressway:

Take the Long Island Expressway to Seaford Oyster Bay Expressway (Rt. 135). Take the Expressway south to Exit 10 (Old Country Road). Travel east on Old Country Road about four (4) blocks, the library is on the right. It is a large library with a parking lot in front. Across the street is a large shopping area. The meeting rooms are in the basement.

Directions from the Southern State Parkway:

Take the Southern State Parkway to Exit 28AN (not 28N), the Seaford Oyster Expressway. Take the Expressway north to Exit 10 (Old Country Road). Travel east on Old Country Road about four (4) blocks, the library is on the right. It is a large library with a parking lot in front. Across the street is a large shopping area. The meeting rooms are in the basement.

Ah, yes. But these 1200's will be going to people that have very
little knowledge about computers. And with the 800XL OS, the BASIC
has to be there (The POC test). I was informed when I delivered them at
our Atari club meeting Friday, that next month I'll be upgrading both to
256K, also a 130XE to 320K. I let Video 61 find and purchase the parts.
They have better connections to BEST, B&C and American Technivision.
Video 61 sales are strickly to the game market. Sooo, Keep
It Simple.

I think a line from my signature got left in where it shouldn't have
been...

But I haven't been able to get any of those util programs to work
reliably on anything I give them. It might have something to do with
my OLD disks, though.

Anyway, try this:
util -w filename

I've found Atario more reliable than Util.

I taught my self 6502 assembly lang and created a utility that I have been
wanting for ages. A remote utility that used the SpartaDos command line.
The result is sitting at ftp.clark.net:/pub/atari/sio2pc-u/remote.com. Check
it out and let me know what you think.

Here is the info on the file:

remote.com
a simple utility to send commands to sio2pc and get the
status of its drives. Works just like the remote utility
that game with sio2pc but it gets its commands from the
command line for convenice of SpartaDos users. It even has a
way to perform a cold start afterwards so you can load a disk
as D1: and reboot. (to run it)

USAGE:

REMOTE <cmd string> | /[s?c]

Sends a command string to SIO2PC or checks up on its drives.

<cmd string> SIO2PC command string to be send. Start it with a "!"
to do a cold start afterwards

/s displays status of drives
/? displays this help screen
/c displays a summery of the SIO2PC command set.',155

(c) 1995 by Kevin Atkinson. You may redistribute as you see fit as long
as this file is distrubuted with it. If you modify the source code
make it absolutly clear that you did and include this message anyway so
that I will still get credit.

I've heard that this happens because the 1050 ignores the index hole.

Not that I know of. Is anyone familiar with what has been done on other
65xx or 8-bit systems?

You know what I would find to be really cool:

A program like "remote" that instead of accepting regular commands
read a data file and displayed a menu for loading disk images, with
the option of rebooting afterwards. Perhaps you could even scroll
through the list with a joystick, and select the image for drive one
with the fire button.

Or maybe someone else is interested in writing one...

(I have a MyDos subdirectory aware menu program for selecting binary
load files from a joystick-controlled menu--written in ABC-compiled
BASIC. I suppose I should get around to releasing it. See my ftp
archives at:
ftp://ftp.cs.dartmouth.edu/pub/crow/Atari/
)

>I don't know whether it's up at umich, in any case I have it. It's a very
>short binary file.

My program also merges overlapping or adjacent load blocks that don't
have an init call between them.

I've seen some load files that have been "compressed" by assuming that
the memory already contains zeros (or using a short init routine to
zero it), and then splitting the load into separate blocks to jump
over any block of zeros of five or more bytes. I didn't put that into
my program, as I didn't want to add an init routine to the files, and
it would slow down the load more than the space savings is worth to
me.

It sounds like the main difference between the program you mentioned
and mine is that the other one runs on the Atari, whereas mine runs on
a PC or Unix system.

For those jumping in now, my program is at:
ftp://ftp.cs.dartmouth.edu/pub/crow/Atari/binload.c
There's also a .zip file with the MSDOS executable, though you should
wait a day or two for the latest version, as the port messed up one of
the error checks.

338. 800XL system for sale

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-11 00:00:00 UTC
From: carmack@comp.uark.edu
Message-ID: <3rduqn$eik@wizard.uark.edu>
Source record: 90910

For Sale: An "orphaned" Atari 800XL (ie not used in many years) with power box, RF cable, and Star Raiders cartrige. Also included are a Rana 1000 disk drive with serial cable and power box. Has track readout on front. No disks available (supply your own copy of DOS for this one). Also, Atari 1027 printer. No power box or cable.

800XL is working (passes built-in Diagnostics and plays a mean Star Raiders) Disk drive appears to be functioning (don't have any disks, so I can't really test it -- turn it on and it clicks to track 00, waits a bit, goes to 39, then back to 00 once it figures out there's no disk, or was that 39-00-39?) Anyway, it doesn't *seem* to have any problems.

I'm moving so I just want to get this out of my menagerie of systems (liquidation time is upon us!) Make me an offer + shipping.

I am planning on creating a program that will create tiny exactables that
will do one thing. Send a specific set of commands to sio2pc and reboot.
This tiny exacuitable could be used in a menu program my simply exacuting it.
>
>Or maybe someone else is interested in writing one...

Even though you seem to have closed your request for help, I would have advised putting a colour change after each one of your loops so that you can see which one it might be stuck in. A sound also works as well. Just for future` reference. Its a technique I find helpful in simple debugging.

- Joel G.

345. Bros 2 update..

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-12 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3rg4pr$lmd@nic-nac.CSU.net>
Source record: 90917

Well, I've added an elegant little piece of code to Bros 2 which replaces the coinbox code. Now, coinboxes can contain anything I want in them (including so far only coins and vines (3rd screen on last beta version)).

ALSO, I can VERY easily make hidden coin boxes anywhere on the screen which contain anything.

Also, the jump problem (you hold FIRE and you just keep bouncing) is 'fixed' (it wasn't a bug, it just wasn't working how I wanted it to). If you hold FIRE, you'll jump up and then land. You must release FIRE at some point (on the way up (which will make you stop jumping), on the way down, or once you've landed) to be able to jump again.

I'm still having trouble with the program acting funny after one play though. Perhaps I should make the program restart somehow after you exit the game...???

NOW, what I'd like.. some people to make levels for the game.. MAINLY because I don't want to end up with a game where I know where everything is and how to beat it! I want to be surprised!! Also, I'm sure any of you who are interested feel the same, so I'd like to get a group of at the LEAST 3 other people to work on it with me.. I'll provide the latest playable version plus a level editor.. but, the editor and enemy controls and stuff haven't been made, so it'll be at *least* one week before I'm ready... but, anyone who'd like to work on it let me know.. you'll of course be in the credits! :)

Thanx!

-bill!

Why not just fix the program so it doesn't do stupid stuff like call
OS dependent entry points or use values that cream XL/XE hardware. If
it won't run with Basic on an XL/XE, disable it and continue (easy!).

As far as CTIA/GTIA, you'd notice that sort of problem fairly quickly.
Besides, who the hell is still using CTIAs?

When I finally got around to figuring out why my loaders failed in
XL/XEs, the fixes were fairly straightforward.

Can you give some specific examples of programs needing this sort of
special treatment?

The one and only Crackerjack.

>I'm trying to use my Mac zip on a PC laptop.

Steve...you'll want to add this to the FAQ:

Until Iomega tells me not to (or until my machine breaks from all the hits), i'm posting the DOS/Win and OS/2 drivers on my machine. i'll get the Mac drivers as soon as i get that new Powerbook with an Ethernet connection. (Any day now :}) That is, unless somebody with a Mac connection, America Online, and a fast link (Ethernet, or 28.8) wants to download those files and binhex them. (That's why i haven't been able to get the Mac ones on. They're not binhexed, and my modem is only a 14.4.)

They're available at:

ftp://pandora.library.ucsb.edu/pub/zip/

PLEASE read the 00_index.txt files as well as any of the read.me files. Things should be pretty clear if you follow the instructions there. Welp...here goes. >:}

I'd be interested in an online magazine. My ftp site (xmission) could have a specific directory for magazine submissions (uploads) and whatnot.

Html access wouldnt be the way to go, though -- how about just a standard TEXT file uploaded to UMIC and my XMISSION site?

Or.. on a gopher server page somewhere.

I just found the files on atari.archive this past weekend. Luckily I
have Linux installed on my machine at home, since the file was tarred
and gzipped. I then found out the schematics are in postscript
format, so I had to figure out how ghostscript worked in Linux.
Needless to say, I got the schematics printed out, and bought the
parts I needed yesterday at Radio Shack. I'm hoping to tonight I will
get a chance to put it together!!

360. Atari stuff for sale

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-12 00:00:00 UTC
From: dgb@owlnet.rice.edu
Message-ID: <3rhraa$k88@larry.rice.edu>
Source record: 90932

These are some 8-bit related items I'm trying to sell.
Prices *include* shipping within the US.

Item # 6 $ 75
Atari 800 console (48k) with power supply, Atari 810 disk drive (the very
first version and in great condition) with power supply, Atari 410 cassette
recorder, BASIC cartridge, RF switchbox, and joystick. Comes with manuals
and Pole Position game disk. [For more software, see item #12.]

Item # 7 $ 25
Atari 600XL (16k) with power supply, RF switchbox, joystick, and two games:
Pac-Man and Centipede.

Item # 11 $ 15
Box of Atari Hardware:
XM301 modem and 1030 modem (with power supply). Never tested.
Atari 410 cassette recorder. Works.
MPP-1100 parallel interface (400/800 only) w/manual. Never tested.
Ape Face printer interface w/box and manual. Never tested.
Atari Remote Joystick. Doesn't seem to work.
Atari Trackball. Has two plugs: one for standard, one for use as ST mouse.

Item # 12 $ 40
Box of Atari Software: All tested, all work, all include manuals
and most boxes. The list: Chem Lab, Sons of Liberty (SSI),
Atariwriter Plus, Printshop and Printshop Companion, Enchanter (Infocom)
Clear for Action (Avalon Hill), Combat Chess (Avalon Hill), Battle of
Antietam (Avalon Hill). Also, I will include original manuals
for SynCalc, SynTrend, SynFile+, and VisiCalc (I lost the disks!).

E-mail dgb@owlnet.rice.edu if interested.

From: Kit Kimes <kimes@iwtqg.att.com>
Message-ID: <DA2M7u.F9I@jackson.napervilleil.attgis.com>
Source record: 90938

#==========b.poehland@genie.geis.com, 6/10/95==========
#
#Kit Kimes described a 256K upgrade he & a friend did at Bell Labs, which
#ran fine for hours at a time but only accessed 192K of the
#available 256K.
#
#I would say Thunder Child is probably performing at least as
#well as Kit's
#machine, maybe better. The Child accesses all 256K of its
#available memory
#with no problem & does not use a custom PAL or re-burned MMU or OS. It
#also runs fine for hours at a time, which is why I'm using it in
#the system
#I keep set up for burning EPROMs.

I agree that Ben's modification is both more modern and probably better
thought out than the one I have running in my 600XL. I would be reluctant
to release the information I have since I didn't design it and would
not want to be responsible for it causing problems for other users.

#Also, I suspect Kit never connected his 256K 600XL to a Black Box/Floppy
#Board with a 44-meg hard drive & four 1.44-meg floppies on the PBI plus
#an XEP80 drawing power (0.5 amperes) from the joystick port, with a 360K
#XF551 & 720K slave on the SIO. That kind of load on the supply & signal
#busses is a formidible environment (I had one XE that gave up the ghost
#with all this junk attached). Thunder Child lasted maybe 1-2 hours under
#that stress before the heat buildup started affecting its performance.
#Much of the problem is just the fact that everything is so darned
#congested in there!

You're right. Running a single disk drive and a RAMdisk with the
C libraries/compiler is as much as I demanded of it.

#But when it comes to video performance, I betcha my Child will blow Kit's
#machine into the dust. Your machine got Super Video, Kit?

Nope, just got the schematic for the 800XL and put all the regular video
stuff in it since it was already set up for that. Probably is pretty
crummy on a TV or large monitor. I always used a 9" color monitor I bought
from Sears. I worked fine but was too small. Probably couldn't do now
what I did then. The old eyes ain't what they used to be. :-)

#Cute little critter, tho, ain't it? An upgraded 600XL is the real
#"sleeper" in the entire XL line! Heck, peple throw them away! <cringe!>

Yes, I always liked my 600XL. The size was right. My 600XL, Indus GT drive and 9 inch monitor didn't take up much space at all. Still more that I have room for today though which is why it is in a box in my storage space.

There is a hardware hack for the XL video, I think it was in a back issue
of Atari Classics, not sure what issue though. It significantly improves
the quality of the XL composite video.

The unknown chip in question #2 should be the FREDDY chip. It handles
memory system control.

Hope this helps

>
>--
>Eyvind Bernhardsen

There seems to be a lot of confusion about this, perhaps I can
relieve some of it. (I disassembled the ROM of an Indus GT some
years ago).

When a disk is formatted in double density, disk sectors 1-3 are physically
256 byte DD sectors, like all the remaining sectors on the disk.

When writing those sectors, the drive only expects (and accepts) 128
bytes from the SIO interface. The remainder of the sector gets whatever
happens to be in the write buffer.

When reading, the drive reads a full sector from the disk, but only sends
128 bytes to the SIO interface. The remainder will be in the drive's
memory, and can conceivably be retrieved by some non-standard method.
(The Indus had some extensions to the standard Atari commands, and I imagine
all other enhanced drives have similar mechanisms).

This feature (restricting the first 3 sectors to 128 logical bytes) is
necessary because the initial bootstrap code in the OS ROM can not deal
with variable sector sizes.

Actually, you don't need a browser to be able to view an HTML file.
You would have to be able to download it (compressed preferrably) and
then run your HTML viewer on your local machine. It's nice, but not
necessary, to be able to read it online. You're right, you couldn't
do that with an Atari 8bit.

>Why not just fix the program so it doesn't do stupid stuff like call
>OS dependent entry points or use values that cream XL/XE hardware. If
>it won't run with Basic on an XL/XE, disable it and continue (easy!).

Yeah, it may not be too hard to fix a program that is XL-incompatible
if you're up on your 6502 hacking skills, but many of us aren't ready
to do that, and many of us don't have complete documentation telling
us exactly which calls are invalid on the XL, and exactly what to do
instead to make it compatible.

As to BASIC on an XL, it would be great to have an init that prepends
to a binary load file that disables it for you, saving a reboot if you
forget.

>As far as CTIA/GTIA, you'd notice that sort of problem fairly quickly.
>Besides, who the hell is still using CTIAs?

I still use my CTIA-equiped 800. True, that one is easily recognized.
It was probably a bad example.

>When I finally got around to figuring out why my loaders failed in
>XL/XEs, the fixes were fairly straightforward.

>Can you give some specific examples of programs needing this sort of
>special treatment?

I was more thinking of people who have both an XL and an 800 who might
discover through a simple trial-and-error experiment that it only
works on one. Then an init could be prepended to the file to detect
the hardware and display a message if the wrong hardware is installed.

I have found a number of files that run only on the pre-XL OS, and
having such an init at the beginning of the file would be helpful for
people with an XL who aren't sure if the problem is an incompatiblity
or a corrupted file.

In theory, it would be nice if when I try to load a file for the first
time, either it would run correctly on my hardware, or it would tell
me that it is incompatible with my hardware.

|> Anyone who knows: How does the Brundles compare to ARGS' Lemmings demo?
|> (Demo's avail. at UMich WRONGLY placed in the Games directory I THINK..)

I have The Brundles, and the ARGS' Lemmings demo. The ARGS demo looks more closely like Amiga Lemmings (but seems to break up some on my NTSC Atari), with better quality graphics. But then Brundles is a real, live, game. In my opinion the lower quality graphics (it uses character modes, with animated character sets) only hurts playability slightly.

Hi all,

There is nothing "specifically" available for the Sweet 16 as of yet. Some existing programs can be patched however to support the powerful Block Move feature of this processor. Word processing inserts/deletes may be accomplished nearly twice as fast...

It comes with the MAE 65816 assembler that supports the full '816 instruction set and 24-Bit addressing, which is pretty awesome for anyone who might want to program in assembly.

I guess that I should clarify that MAE does come in "TWO" versions and that the version that will only run with a Sweet 16 is faster than the standalone 6502 version...

I've been doing a tremendous amount of work with the '816s, and it's only a matter of time before exclusive software becomes available. (Maybe with the "linear" memory on the MARS 8 board. hint hint.)

Thanks for the inquiry. Mike

From: ivan@rcp.co.uk
Message-ID: <vwY3vAdMBh107h@rcp.co.uk>
Source record: 90809

Hi,

Does anyone know the format of a DOS directory? more specifically
the first byte.

In the sector that contains the directory there is 5 bytes before
the textual file name. Bytes 2+3 are the length of the program in
sectors and bytes 4+5 are the start sector of the program but what
is the first one?

I have seen the following values: (hex)
03 ??
23 ??
42 Seems to be a standard single desity file??
43 ??
60 ??
62 Could this mean the file is stored in sectors > 720 ??
80 ??

Also how can you tell how many items are in the directory?

Thanks for any help

Ivan

Why bother with all the hassle of an HTML viewer? Why dont we just have standard TEXT files like the old Zmag -- or better yet, we use that CARDSTAX (or whatever its called) program and
view it in that format. At least with CARDSTAX, its a usable ATARI program, and allows for the
insertion of graphics and sound.

Derek; no slam on your emulator, I just don't have a PC capabile of running it decently, but as far as convergence of ideas: I think several people have thought the same thing with a snooping SIO2PC cable. Just that IMHO, most people that can write the software are already off doing their own projects so it remains a low priority. Figure everybody with the setup you would need to do the task already has at least one real 8 bit & one real drive so it would just be a certain level of redundancy. Maybe I'll change my mind when I upgrade my clone, but right now I have about 7 functional real Atari drives & the same number of computers. If I hit zero on either count I'll suddenly become REAL interested.
I will offer to make a PC2SIO cable for you if you want to have a real Atari drive hooked up to a IBM style serial port, I hate the printer port thing that much! I don't want to bother with the writing the software though.

#a used 850 or something to null modem them over with. Ouch. Unless
#all you have is the disks and no 8-bit hardware, then I concede such
#a service has merit..

I have plenty of Atari 8bit hardware. 2 computers, 2 disk drives, a
1200 baud modem, etc. I just don't feel like setting it up everytime
I want to use it. What I would REALLY like is a way to hook my Indus
GT drive up to my PC and have the emulator use it directly. Kind of a
SIO2PC in reverse. That would (maybe) allow you to use your copy
protected software without cracking it or playing around with funny
timing routines. You would need a way to boot the emulator using the
Atari floppy drive as the boot device for it to be meaningful though.

> and understand the raw images.

Has anyone considered a utility that uses the SIO2PC cable to snoop the activity taking place between the Atari computer and real Atari disk drive and simply logs the disk command being sent, the data being sent back, and the relative timing. So copy protection really doesn't matter, because all you care about is what the drive sends back to the computer and when. An emulator such as PC Xformer could easily emulate something like that, permiting you to run any copy protected piece of software.

Similarly, if you "replayed" the disk activity to a real Atari computer you could run copy protected software on the real Atari without ever having to actually copy the protected disk.

I'm sure in 15 years someone must have already done something like this on the Atari 8-bit.

>Rick

Rick,

The important point that I neglected to spell out is the fact that the
SIO command to the disk drive contains only the sector number, and not the
byte count. Therefore it is necessary that the disk drive and the
program agree on the size of the data records. Given this constraint
in the original design of the disk drive protocol, I can think of the
following ways to accommodate booting from double density disks.
1. the 1050 approach (26 128 byte sectors) which wastes lots of space.
2. using 18 256 byte sectors, but faking the size of the first three
(the standard DOS boot sectors)
3. putting code in ROM that tries to boot with 128 bytes, and, if that
fails, tries 256 bytes (or vice versa)
4. putting code in ROM that tries to determine the type of disk drive,
and then reads the appropriate number of bytes
5. mapping 2 128 byte logical sectors into one 256 byte physical sector
in the drive. (This runs into lots of problems when writing single
sectors...)

Choices 3 and 4 are not compatible with existing OS ROMs, so I guess choice
2 was a reasonably sensible one to make.

My Indus is packed away and not readily accessible. I know, however,
that read and write commands to the first three sectors only transfer
128 bytes on the SIO bus, regardless of disk format. As I said in my
earlier post, there is a back door. There is a function that lets you
deposit bytes in the Indus's memory (i.e. a piece of Z80 code), and
another function that will leap to that code. With that you can do
anything you want to those sectors, but that's a little outside the
scope of normal operating parameters.

I've been following the discussion of the possibility of the magazine, and I humbly submit that the method of transmission may be a trifle premature. It occurs to me that the content may be a little more important at first. Then, how will it be supported -- i.e., simpy a freebie or will "subscribers" pay somebody -- and finally the transmission method. It's understandable that this would be the most interesting to people who like technical challenges, but I think the "editorial" challenge should come first and foremost.

I would hope that such a publication would have at least a small section devoted to those of us who use 8-bits for various tasks, as well as fun, but really aren't "techies" like I presume many, if not most, of the contributors to this group are. (I assume no one is going to take offense at my use of the term "techies." I have the utmost respect and admiration for people who know their way around the inside of a computer.)

Hello,

I seem to remember from my Atari days, that somebody came out with a program which intercepted the disk read routine, and looked at the timing between sectors, the data read, the error code, etc. There was also a board available. You booted the software, then loaded whatever disk you were trying to copy, and then you went back into the software. It then read back all the data that was read from the disk, and wrote out an image along with the timing data and error codes. In essence creating an unprotected image of the game.

It seemed to work fairly well, and when you loaded the copy software it played the theme to Mission Impossible. Does anyone know the name of it?

Thanks,
Mack

Sig? I don't need no stinking sig...

404. No Color from 130XE

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-13 00:00:00 UTC
From: your name <your_name@cv.hp.com>
Message-ID: <DA3B9F.IHs@hpcvsnz.cv.hp.com>
Source record: 90830

I purchased a backup 130 XE which lost its color (i.e. on the monitor).
It does not have color on a color TV set either. My original 130 XE works
just fine on either video (TV or monitor). I reseated the IC chips and
cleaned the keyboard trace connector, but with no success with the color.
Does anyone have a suggestion to remedy this colorless situation.

Thanx, from a pale hacker!

Given that the floppy drive on most modern PC's are operating on much
higher tolerances (due to HD), this would be a problem. I noticed this
when using MYUTIL. Going from a disk formatted on a PC, and using that
on a Atari drive (dbl density) works, sort of...

Seconded. Reading "magazines" on a computer screen is hard
enough--reading a web-page sorta thing is worse.

I'm more concerned with content and good editing than anything else. I
wouldn't mind if _Atari Classics_ or other Atari magazines were simple,
non-DTP newsletters put together at the local copy shop. It works well
for stuff like Shareware Solutions II (Apple) and The 2600 Connection.

I have an Atari 400 that I had upgraded (years ago) to 48K. I pulled it
out of the closet and have been using it for the past few weeks, and today
it started acting up on me. Like not booting. So I pulled it apart, and
sure enough, the jumper wires for the upgrade had come loose - not all of
them, but once I saw the first one loose I (silly boy) tugged at another,
and it too came off (bad soldering job, I guess). Anyway, does anyone
have specs on this? If they can be faxed to me, that would be great - or
scanned in and emailed, or just plain USmailed...Please Help!

Alan, I *assumed* the publication would be free; simply posted on FTP sites and the world-wide web.

The format is a bit important because I don't think anyone's going to want to sit down for the first issue and manually convert every submission!!

We could simply do TXT or we could do scaled-down HTML (I'm for this) which would make it easy to put up on the web and coding a simple HTML viewer is relatively trivial or make up some format or something..

Now, would there be software included with the issues? (ie, demos, PD stuff, etc.?)

I think we'd be fitting in the niche right next to e-mags like Top-Magazin, except we'd be english. (BTW for those who don't know, Top-Magazin's doc reader has the ability to include inline graphics!!!)

As for the techi-ness of the magazine, well, MY contributions would be technical, but not hard-ware. I DON'T know the ways in and out of XL's. :)

>03 ??
>23 ??
>42 Seems to be a standard single desity file??
>43 ??
>60 ??
>62 Could this mean the file is stored in sectors > 720 ??
>80 ??

My understanding of the first byte is that each bit has a different
meaning, unless they're all zero, which indicates that there are no
more entries (there are a maximum of 64 entries).

I'm not sure of all the bit values, but I'm pretty sure about the
following:
7->deleted
6->normal file
5->locked
4->MyDOS subdirectory (Atari DOS meaning???)
3->???
2->???
1->???
0->write open

So $42 means a normal file and bit 1. $62 is the same thing, only the
file is locked.

I suspect bit 1 means the file may have sectors > 720, and bit 2 is
used by MyDos to indicate "long" sector numbers instead of file
numbers at the end of each sector (allowing for >1024 sectors on the
disk). Can someone confirm the meanings of bits 1-4?

Thanks.

Hans; correct me if I'm wrong, but the reason the boot code only handles 128 byte sectors is because it jumps through the DINV vector which sets the sector size to 128 bytes regardless of the drives capabilities. SIOV should be able to handle anything, I have my ATR8000 reading 512 byte sectors for instance. Do you still have a working Indus (my son's was stolen by postal workers when I mailed it to him)? It would be interesting if for no other reason then curiousity sake to find out if you can use the extra space.
Rick

From ANALOG Compendium, Disktool Rev. 3
First byte is status byte, like the man said.
Bit 7 6 5 4 3 2 1 0
File Deleted/Fle in use/Locked / Spare bytes /DOS 2/File open for
output(word wrap)
MyDOS uses 4 apparently to indicate it is a MyDOS disk.
How to tell how many files in a MyDOS/DOS 2 directory? Well I'm not
sure about MyDOS, but DOS 2 doesn't know how many files are in the
directory. It just keeps searching the 16 byte directory entries until
it finds an invalid char(probably not) or a 0 in bit 1 of the status
byte maybe?

Sorry, I don't have 130XE schematics but I should be able to help you
out using the old 800 set I have.

1: Check pin 17 of the GTIA while adjusting the color trim pot, It
should be the only pot (500k) on the board. Look for a swing of from
close to zero to almost 12 volts. If you are missing 12 volts from your
power supply you are in trouble with color. This sets up the level of
some internal schmidt triggers that sets the color phase angle (NTSC
tint control).

2: Could be a bad GTIA.....but this would be a very unusual failure
mode.

3: For an NTSC system the system clock must be RIGHT ON for color. If
you have a frequency counter make certain the signal at GTIA pin 28 is
3.579545 mhz. If a counter is unavailable try tapping the crystal (not
to hard) and sometimes that will make the color snap in!

4: There is an NPN common emitter transistor on the board somewhere
coupled to pin 21 of the GTIA (color line)....it could be bad or one of
the capacitors bad.

Use the good 130XE and compare signals, swap GTIA....etc for an easier
time.

Are you certain its not a PAL system? :)

Jerry

Well, the thing is, wouldn't we all sumbit the articles to an editor(s)??

THEY could reformat the thing into HTML...

I said why not have an in-between which can be viewed as text, HTML or
with a viewer on the Atari 8-bit.. HTML would let everyone else
(Mac, PC, Unix, VAX, etc.) view it, text would let EVERYone else
(other systems!) view it, and the viewer on the Atari would be in between..

The in-between could be like a scaled-down version of HTML...
Why not even an editor on the 8bit for this file format??

416. I killed my 800XL! Please help me!!!!

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-13 00:00:00 UTC
From: HEGEDUS@mszi.pmmf.hu
Message-ID: <768C4F31E1@mszi.pmmf.hu>
Source record: 90842

Hi,

One day I volunteered to do the 256k upgrade in my 800XL. But I
didn't have any 41256 but I could get some 414256 at bargain price.
Ok, I think it wasn't a bad choice, but I didn't know the pinout for
this RAM. I was very happy when I found the pinout of the 424256, and
I think (and some people said too) there is no differences between
them. But you know I wasn't OK, and when I built the upgrade with this
RAM my old Atari couldn't stand it without any vendetta.
Now I'm very unhappy, 'couse I don't have any 64k.
So I have some questions:
Where can I find a good (or something like that) schematic of
the 800XL?
What's the ID (like U27) of the 65c02 in the 800XL?
Is this 65c02 a REALLY 65c02 (from Rockwell?)?
Who wanna sell me a really cheap one?
What can I do now?
And some other question:
The Enhanced .atr is about 140000 bytes and the real atari
Enhanced (like the .xfd disks) disk is 133120 bytes. Why? The SD disks
are OK... I know there is a $10 bytes long header in the .atr...

So, that's it.
Please HELP me!

THanks, (not Tom Hanks)

Mathy Van Nisselroy <mathniss@link.xs4all.nl> writes:

>Howdy Mike
>
>Now that you're in Arizona;
>
>When can we expect to see you products?

Hi Mathy!

Well, I've been here in AZ now for almost 6 weeks. I don't know
my way around here yet, and with all the time that I've been putting into
work, I don't exactly feel like I've "settled in" yet. Unpacking stuff
has been a major drag! It took me about 3 weeks just to find the MIO II
prototype, but it survived the move and is running fine now.

I've finished the manuals for the "Sweet 16", and they should be
starting to appear within the next week or so. I had a problem with the
latest version of the MAE assembler, and needed to get it fixed before
sending it out with the manuals.

The move has been expensive, so I'm just trying to get a little
bit of extra cash together to get the boards into production. (MIO II)
The MARS 8 is getting very close to completion as well, and will be released
right after the MIO II.

I did manage to make it to the NWPAC meeting in Phoenix last Sat.,
and sign up as a member. Dale Wooster (Prez) has a really nice manual that
is available for the latest version of TextPro, and is highly recommended.

I do have a lot more space here than I did in CA, and it's amazing
how fast it all seems to evaporate when you're working with the Atari's.
My place is literally "decorated" with 'em, and it's a pretty cool vibe
as long as all of the power supplies remain tucked away.

It looks like I'm gonna be here for quite some time, and now that
I've managed to get all the computers set back up and running, I feel
really positive about getting caught up this summer on all of FTe's
projects. I've got a few suprises in store, and will be discussing them
at length once the MIO II and MARS 8 start to ship.

I've also been working with a scripting terminal language called
CASL, and should be able to automate the new catalogs, updates, etc. via
E-Mail here very soon... I haven't forgotten about anyone, and now that the
"move" is essentially over, FTe should have a much stronger presence in the
market by July or August.

Thanks to everyone for their trust and patience. It's been a long wait for me too... <grin>, but FTe is in better finacial shape than it ever has been, and quite franky... I couldn't imagine having a better time than I do when working on the Atari's 8-Bits. (With the Sweet 16 now available, the Atari's "could" be referred to as 16 bitters... pretty weird, huh?)

Mike (FTe)

Hardware
--------
Atari 800, 48K, all original, w/ power supply
Atari 800XL, w/ 128K (Newell Memory Expansion board), power supply
Indus GT Disk Drive, door removed, works fine
Atari 1050 disk drive, not working
PowerStik II joystick
P:R: Connection interface for generic printers, modems, etc.
joystick extender cable

Documentation:
Magazines/Manuals
-----------------
About 2 boxes full of Atari magazines and software manuals
- includes COMPUTE!, Antic, ANALOG Computing, Atari Explorer, Atari
Classics, etc., plus original manuals for MAC/65, Atari LOGO, 1st
XLEnt Word Processor, Atari Assembler/Editor (with lengthy errata
bulletins from Atari!), Jerry White's Music Lessons, dozens of games,
etc.

About 2 boxes full of books
- includes Atari Roots, Programming the 6502, Atari BASIC Sourcebook,
Mapping the Atari, The Atari Assembler, Inside Atari BASIC, Your
Atari Computer, ZAP! The Rise and Fall of Atari, Inside Atari DOS,
Atari Assembly Language Programmer's Guide, Stimulating Simulations,
Machine Language Programming for Beginners, De Re Atari, The Atari
Compendium, Dr. Wacko, many more.

Software
--------
DISKS: over 500 (!) diskettes w/ Atari software, various formats
- includes DOS 2.0, 2.5, 3.0, TopDOS, Mydos, and other DOSes; 1st
XLEnt Word Processor (2 versions), VisiCalc, Zaxxon, Stellar Shuttle,
Raid Over Moscow, Beachhead, Beachhead II, Star Raiders II, The
Eidolon, Necromancer, Fooblitsky, Super BoulderDash, BoulderDash
Construction Set, The Nightmare, Diskey, Disk Wizard II, Music
Construction Set, MicroPainter, Canyon Climber, Ball Blaster, Raster
```

Blaster, S.A.M., PokerSAM, ABC Compiler, various drivers for modems and other external devices, Atariwriter printer drivers, many Antic and some ANALOG Computing disk issues, LOTS of Public Domain, original and typed-in magazine software and data files, and MUCH more.

CARTS: over 2 dozen misc. Atari games, programming languages, etc. - Donkey Kong, Defender, Star Raiders, MAC/65, Assembler/Editor (2 versions), BASIC (2 versions), Crossfire, AtariWriter, Jumpman Jr., Rescue on Fractalus, Battlezone, PacMan, Miner 2049'er, Music Composer, Missile Command, Mario Bros., Atari LOGO, Airball, Frogger, Blue Max, Centipede, QIX, etc.

Modems

Microcom AX-2400C 2400 baud modem, MNP5
Anchor Volksmodem 1200
Atari 1030 Modem, 300 baud
MPP 1000E Modem, 300 baud

#==========Darryl Lee, 6/12/95==========
#
#Until Iomega tells me not to (or until my machine breaks from all the
#hits), i'm posting the DOS/Win and OS/2 drivers on my machine. i'll
#get the Mac drivers as soon as i get that new Powerbook with an
#Ethernet connection. (Any day now :}) That is, unless somebody with
#a Mac connection, America Online, and a fast link (Ethernet, or 28.8)
#wants to download those files and binhex them. (That's why i haven't
#been able to get the Mac ones on. They're not binhexed, and my modem
#is only a 14.4.)

Darryl,

I have access to AOL via a 28.8K modem at home or TCP/IP here at work.
Getting the files here would be no problem. I don't own or use a MAC,
so I'm not familiar with 'binhex' files. Is this something I could do
for you either on a PC or on UNIX? If so, I would be willing to do it
and upload it to your site. Please email me privately if you are
interested.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

Don't know if this is the best newsgroup, but perhaps someone could point me in the right direction...

I have a floppy disk from an old, old Atari computer, with files that I wish to retrieve. Norton utilities on an IBM PC, as far as I can tell, has no idea how to read from this disk, since it's formatted using 9-bit bytes. No Macintosh to which I have access is able to read this disk, either.

Any ideas? If anyone has (a) an old, old Atari, (b) software that could read from this disk, or (c) any other idea how to retrieve the data, please let me know. Thanks.

Rob Hubal

>Does anyone have a suggestion to remedy this colorless situation.

Had the same problem with a 800 XE.
First look at the potentiometer (R 38) I think. It's for the color
adjustment !
Then swap the GTIA's between your two computers (if they are in a socket).
The fault on my system was that an 74ALS74 (or 74LS74, don't know it for
sure, but only 74XX74 is important) was dead and so the GTIA got no color-
clock signal.

If you have still questions or problems, send me a mail !

From: gladius@I_should_put_my_domain_in_etc_NNTP_INEWS_DOMAIN
Message-ID: <3rn65f$pfk@news.yab.com>
Source record: 90760

I recently purchased a U.S. Robotics Sportster 14,400 external modem for use with my 130 XE (with 850 interface). The problem is I can't get it configured properly. Many ff E-mail posts to USR indicate it should work with any computerif it is properly set up. The UK office offered a couple of sets of type in AT commands & say to use default parameters on switches. If anyone out there is using this modem on your trusty 8 bit please share the switch settings any any config file or AT set you are using. I only use 8 bits and being stuck on the net at 2400 after finaly saving up for better is a real drag. I tried some semi educated trial and error with the dips but with 8 switches there are 256 possible combinations. Any help would be greatly appreciated. Please E-Mail to gladius@host.yab.com

Message-ID: <140566@cup.portal.com>
Source record: 90761

Cameron, you are using it with MyDOS right? As much as I like Sparta, I usually have to do:
DIR<return>
To which it NAKs
DIR<return>
to which it responds. It's pretty consistant in that with SDX, I don't think I've been able to ever access drive 2 for anything, drives [1,3,4,...,8] sorta work, but never in high speed mode, & I think the only drives I can format for sure is drive 1. It's a little bit less problematic with SD 2.3, it says the drives can't run HS, but goes ahead & uses it anyway. I haven't tried it with 3.2g or f yet.
Anyway, if your clone has a CMOS setup, there's one other thing you may want to try; go to the Advanced or Chipset menu <if there> & play with the buss clock. If it's AMI BIOS it may/could offer some options like:
Buss clock CLK/6
What I've found isn't pretty, seems most cards that get returned or discarded<sic> were brought back because they didn't run in a faster machine. The stores just check these out in a slow machine & if it works
1) Put in back in the packing & back on the shelves
2) Put it in a budget system bundle
The stuff you have to watch out for is any of the $11 [IDE, Floppy, Serial, Printer, Game] all in one cards & just about any 8 bit card from video to serial.
Rick

Cameron Tully-Smith (cameron@zippy.sonoma.edu) wrote:
: Hi, everyone.

: I'm having an interrmitent (?sp) problem with SIO2PC, which is running in
: "de-turbo" mode and using physical disk access (by using "filename/P" for
: each disk), at Bill Kendrick's suggestion...

: Originally, the Atari couldn't read the disks reliably/at all (using the
: "turbo" mode of the 386 and standard disk access, without the /P), but then
: I slowed it down, and it seems to work fine, *most* of the time...

: Once in a while, the Atari will just hang while reading a disk from SIO2PC,
: and will do other weird stuff.

: I'm posting this because Bill Kendrick (kendrick@zippy.sonoma.edu or
: kendrick@vax.sonoma.edu) says that various other people have had trouble
: running SIO2PC with some faster machines, and he thinks this might apply to
: a 386SL-20. If it does, does anyone have any info on "timing" values or
: other options?

: Thanks very much in advance for any help you can give me :)

Are you sure your using the correct version of sio2pc? If you have the 2
chip version of the cable, you need to run sio2pc2. The single chip
version uses sio2pc.com. The diffrence between the two is that sio2pc2
'cooperates' with other SIO devices by MANAULLY taking the cable offline
when its not active.

If you continue to have operability problems please e-mail me, I would be
happy to let you test my beta sio2pc software on your machine.

Steve

431. Re: SIO2PC -- problem with a 386SL-20

I find that SIO2PC runs just fine on my 386DX-20. It chokes if I run
it under Windows, unless I make it run in exclusive full-screen mode.
Once in a while, it seems to get out of sync, and the Atari fails on
an I/O, but not often. I think this may be due to the overhead of
having a large (8meg) disk image on a compressed disk.

I wonder if getting a new serial card with the 16550 buffering UART
would help?

Enhanced ATRs were created as ~140K files by some of the earlier versions
of SIO2PC because Nick Kennedy was misinformed to their actual size.

They SHOULD run fine, but if not, you may be able to duplicate a 140K ATR
onto a newly created (correct size, ~133K) ED ATR with a DOS on the Atari..
Note the "may", however. :) This is, of course, if you're having problems
with 140K ATRs.. if they give you no problem (other than wasting 7K of
disk space) then don't bother..

Source record: 90849

Hi, everyone.

I'm having an interrmitent (?sp) problem with SIO2PC, which is running in "de-turbo" mode and using physical disk access (by using "filename/P" for each disk), at Bill Kendrick's suggestion...

Originally, the Atari couldn't read the disks reliably/at all (using the "turbo" mode of the 386 and standard disk access, without the /P), but then I slowed it down, and it seems to work fine, *most* of the time...

Once in a while, the Atari will just hang while reading a disk from SIO2PC, and will do other weird stuff.

I'm posting this because Bill Kendrick (kendrick@zippy.sonoma.edu or kendrick@vax.sonoma.edu) says that various other people have had trouble running SIO2PC with some faster machines, and he thinks this might apply to a 386SL-20. If it does, does anyone have any info on "timing" values or other options?

Thanks very much in advance for any help you can give me :)

442. Freezer for Atari 8-Bit

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-14 00:00:00 UTC
From: fom@iller.zfe.siemens.de
Message-ID: <3rm6p4$oh0@ztivax.zfe.siemens.de>
Source record: 90850

Hello,

in 1986/1987 I developed a freezer for the Atari 8-bit
machine over here in Germany, that was almost completely
based on software. The only piece of hardware necessary
was a switch to cause an NMI. The freezer software
was loaded under the OS and activated via the switch.
In contrast to simple monitors, the software was
capable of determining the contents of the 'read only'
custom chip registers (?!). This was achieved by utilizing
side effect like bus timing and similar stuff. Only very
few registers had to be adjusted manually. The program
was then written to a self booting disk and could be used
completely independent from the freezer. The package also
included a debugger which was roughly compatible to the Atari
Assembler/Debugger cartridge. Another component was an archiver
which read the self booting 'frozen disk' and converted it
into a compacted file which would also run without requiring the
freezer. You could even write to cassettes this way.

The problem with this is, that I would have to
dig out the source and find a replacement DD-capable
drive to compile it. Back then the freezer software was
very heavily copy protected which would have to be removed
in order to put the software into the PD. (BTW, copy
protection involved physically damaged disk zones).

I think this freezer would come in handy in porting
copy protected stuff to PC Xformer. Has there never been
any other software freezer on the market ?

Another problem would be that maybe the loader routine
for the frozen images is not yet compatible with PC XF
in its current state. I noticed several boot disks including
RANA DOS screwing up the emulator ? Anyone experienced similar
problems ? BTW, I verified the integrity of the bootdisks
by running them on a real Atari and there they worked !

Another trick is to run the guest program to mount the ZIP drive, run the
iomegatools program to write-protect the 100M install diskette. This idea
came from Mr. Lee Busky whom I bought a used ZIP drive and diskette from.
When I received the drive and install disk, I can install the ZIP on both
MAC and PC without troubles. :)

NO! This won't work, AFAIK. At least from the Mac side, the Zip Tools disk
appears as a write-protected, PASSWORDED 50 MB cart. The install process
removes the password along with the write-protection & the other
partition. Here's how I did it:

Used guest to mount the Zip Tools original.
Used Disk-to-Disk copy to make a Zip Tools COPY on a blank Zip cart.
Installed off the COPY.

I have no idea if the D-t-D copy kept the DOS information, but it doesn't
matter since my original is still intact.

FWIW,
Tim

Exactly what kind of Atari computer is this? And what kind of drive is it
from?

>no idea how to read from this disk, since it's formatted using 9-bit bytes.

Never heard of a 'disk formatted with 9-bit bytes', the earlier Atari drives
like the 810 and 1050 used FM format on their disks, and I believe you have
to have a controller on your PC that can handle this, most of them are MFM,
and only support MFM, but some are able to handle FM. There is several
utilities that will allow you to read your FM formatted Atari diskettes.
Also there were some Atari drives which used MFM format, like the XF551 and
I think it is possible that the Percom's did as well (can anyone confirm
that?) use MFM. Look on atari.archive.umich.edu under /atari/8bit, you
will be looking for something called util or something like that, it should
be in a zip archive.

>Any ideas? If anyone has (a) an old, old Atari, (b) software that could

Again what is an old, old Atari? The only thing I would think that you are
talking about is an Atari 8-bit which would cover 400, 800, 600XL, 800XL,
1200XL, 65XE, 130XE, and XEGS. (Not even thinking about hybrids and
prototypes like the 1200, or the 1400XL, 800XE).

Now if this is from a 520ST, a 1040ST, or so on then they are MFM formatted
and I heard that they are easily readable from MS-DOS machines.

Couldn't quite figure out where to post this, so I thought I'd try these four Atari newsgroups. If it's inappropriate, I'm sorry. I figured the best place to find those who might be interested in these would be here.

While going through a couple boxes of comics that I'm about to sell, I found something that made me think about the past. Back when Atari was on the brink of ruling the world (:)) they stuck their fingers into everything they could, into all forms of media. One of their forays into the world of comics was the "Atari Force" comic book from DC. Being a loyal Atarian those days, I of course bought them.

Anyway, I have the complete run of the comic - Issues #1-20(2 copies of #6) and the Atari Force Special #1. This would be great for anyone out there who likes to collect Atari merchandise (and really, the story and artwork weren't all that bad...surprised they never turned it into a videogame).

I don't have a set price on these...I'll simply sell them (all together) to the best offer. Don't include postage and handling in your offer, will talk that over after they are sold.

Send all offers and any questions to me at: gladiatr@clark.net

Thanks.

-=>Donald

I have seen (at least I think I did) the ZIP Mac disk and the ZIPTools on Compuserve in the Iomega part (Mac Vendors C, if memory serves me). Since I do not yet have a ZIP (they should be arriving here in the Netherlands any day now) I didn't see the point in downloading the files.

Well, I tried it again on Mac. Write-protection was done on Mac P630 with
the guest and IomegaTools. The DOS partition is still installable on the PC.
Has anyone tried this out yet? This only work for the new Install Disk. :)

Hi Rob,

It could be that the disk you have is an '8-bit disk'. I've never heard
of a 9-bit byte formatted disk (1 byte==8 bits, no more, no less). It
could be that it was formatted on an 8-bit machine (eg, Atari
130XE/800XL, Commodore 64 etc). The only way I know of retrieving the
data on the disk is to try it in these machines to see if you can access it.

Best of luck, hope this helps!

>is the first one?

The first byte states whether the file is open for write (W), deleted (D) or
locked. For the correct values I'd have to check a reference. In the case
of DOS 2.5 it probably does state whether the file overspills into the
enhanced density area (720+) but I don't know what the configuration
is here.

>Also how can you tell how many items are in the directory?
64 maximum. DOS stops when it reaches the first empty entry, hence
some hidden directories are based on putting the filenames above empty
entries. Note that a deleted entry is not empty.

On the subject of DOS images, does anyone know how the VTOC of an enhanced density disk works? I think sector 1024 is used to keep the VTOC of the additional sectors (i.e. 721 to 1040)

Cheers,

I think you just need a couple wires that you somehow attach to your
skin, and attach the other end to a paddle pin and ground. Maybe put
a pot in there for calibration, and (theoretically) the less
resistance, the more you're stressed.

I don't think so. I think it's all in the same place, but the files
that go beyond 720 have a flag in the directory entry.

And of course, sectors 1025(?)-1040 are unused in DOS 2.5 enhanced
density. Analog once printed a program that used that area to store
file descriptions.

Body handling: HTML body converted to readable text

Ben; I have a copy of this that came with the MMG compiler, but I'll just about garantee that if you had this you wouldn't use it. It really has the look & feel of DOS II with the only exception being the density switching. In order to change density you have to run a program, CHANGE.OBJ, that reprograms the drive & modifies the DOS on the fly. You need to do this *EVERY* time you switch disks so you need a single density & double density version of CHANGE on two disk to work with it. It seems brain dead compaired to SD or MyDOS. It's really meant to just switch to double density for applications that need the extra storage, like a compiler for instance, & stay there.
BUT On the topic of transfering disk images, like DOS IId, I did get off my butt & investigate the MicroIllustrator compression format. Needless to say my results were completely underwhelming. Loaded MyDOS DUP.SYS into a gr.15 screen & saved it with horizontal compression. Resulting file actually gained a little weight. This was a little disappointing but I'll stick with it for a while. I looked through DUP.SYS & there were all sorts of repeating characters so the problem seems to be the compression algo's with Diskcomm & Micro have a little to be desired. There was an article in DDJ describing the problems & an alternate method described that keeps files from bloating like this. Could someone post the actual amount of files on SD32F or how much free space is left on the Discomm disk? I'd like to get a generic mover going that will let you copy files via CIOV & any range of sectors via SIOV as well as move disk images of any size, but this compression thing with stuff like SD32F.DCM being 84k is bothering me.

I think you're referring to a product from Happy Computing :). I
can't remember what the product was called, but it was *real*good*
at copying almost anything. The guy who ran Happy was a real hacker
(in the good old sense), and would update his product as fast as
they came out with new C.P. schemes. He later did some system
software and hardware mods for 800s and 810s that greatly increased
the SIO speed (instead of beep beep beep it sounded like a dentist
drill!)

I wonder whatever became of him.

Hi! Just a quickie - I was wondering if anyone knows of any
emulators for any of the 8-bit Atari range (I`ve got a 130XE) for use on
an A1200? Is it possible to connect up a 1050 diskdrive using a custom
interface?
Cheers,

Mark.

461. Undocumented SIO Commands

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-15 00:00:00 UTC
From: classics@en.com
Message-ID: <3rpvfu$ovo@antares.en.com>
Source record: 90783

Is there any refrence for information on the undocumented SIO commands?

I recently added support to my software for the spartados $66 'format ultraspeed skew' command and noticed that it also attempts to use a command '@' when booting up.

Is the '@' command directed at some HD interface or time device? Any help would be great.

Also, there seem to be alot of undocumented 1050 SIO calls. Ive seen alot of them while using the 1050DIAG program. These include $23, $24, $FE and a few others. Any ideas?

Thanks

Steve

462. Oki Color printer/other goodies

OKIMATE 10 color printer (if you can find the color or BW ribbons, works great) with an Atari plug'n'play interface module. $50.

Epson MX-80 9 pin dot matrix printer, manuals, power supply. In good shape. $40

Also KoalaPad with software, WICO joystick, etc. All power supplies, cables, bag o' extras and goodies (cables,chips, ROMs, etc.) $35

Prices do not include shipping.

Contact DavidN9000@AOL.COM if interested.

I can think of one tip...
Hardware handshaking will not work, so make sure the modem is set for
either software (XON/XOFF) handshaking or none at all.

Has anyone ever tried writing a program to get pot readings every two scan lines or more? I did and it has'nt worked. I set bit 2 in SKSTAT and then mapping the atari says you have to reset it too to drain the capacitor it uses to read the pot so, I made my routine toggle bit two on and off after I initially blank the screen, reset the HW, turn off the NMIs and IRQs, and whatever else I thought nessesary. The most I got was some nearly random buzz and thats after I also poked POTGO in my loop. Its made in action/ml just incase you thought otherwise. Anyhow, it dos'nt work and without the potgo, the pot dont reset ((bit 2 dont do it either)

Can anyone help? enyone ever try this stuff? I've used antic sample proccesor and that works great but I DONT HAVE THE MAG!!! Anyone have the issue this program came out of?

>having such an init at the beginning of the file would be helpful for
>people with an XL who aren't sure if the problem is an incompatiblity

>or a corrupted file.

Many programs were -um- 'prepared' prior to the apearance of the XLs
and due to the way they operate caused problems or just plain failed.
Every one of the programs I 'massaged' prior to my getting an XL fails
on them. Whoops!

I have taken the trouble to change most of my files so they have my
new headers on them that work equally well on both types of machines.
Sorry, I realize that doesn't help you any.

I hereby offer my services to aid and assist anyone with code that
won't run on an XL. Likely as not, I can make it run. Especially
converted binary files with stupid headers (like my old stuff).

>In theory, it would be nice if when I try to load a file for the first
>time, either it would run correctly on my hardware, or it would tell
>me that it is incompatible with my hardware.

Well, yah, but who is making new stuff now anyway?

Anyway, like I inferred above, the reason stuff doesn't work is
because someone either make the stupid decision to jump to a changable
OS handler address (they didn't believe Atari when they said only
certain address are written in stone) or they inadvertently wrote to
one of a couple of locations that cause the XL to map Basic back in or
cold boot when reset. Mapping the Atari (the updated version) spells
out fairly clearly where these problems are likely to occur. If you
are interested, I can post a digest version of these things or
photocopy you the relevant parts (no scanner yet).

Email me, we can talk.

ciao

I've often considered doing that, but never bothered. I don't live in
a high crime area (small suburban condo complex surrounded by swamp,
highway and woods. Everyone looks out for each other here.)

Anyway, You could hook up many more than that if you use a polled
system with address decoding so you could address a bank and get their
current status. Letsee... 8 output bits=256 banks, 20 inputs (assuming
the paddle pins were used) remaining, so 256*20=5120. If you went all
out and decoded 16 output lines (64K) and used 12 input lines... well
you get the idea.

I like that quote!

JH> the same results. Any Suggestions?

A mistake I make all the time when trying out a new modem program is
not to set the baud rate. Old terminal programs often come up with a baud
rate of 300 or 1200 BPS. New terminal programs often come up with a baud
rate of 2400 BPS. Often, in my excitment, I forget to match the BPS rate
of the terminal program with the BPS rate of the modem, especially when I
am using a new terminal program for the first time. I then wonder why the
modem isn't echoing my keystrokes. It is an obvious problem, but I always
manage to somehow overlook it and keep double-checking my interface cables.

471. Biofeedback devices?

Ok, I'm watching a good episode of NeXT Step and they just had a bunch of stuff on stress-relief devices and biofeedback stuff..

Now, >I'D< like to know what type of biofeedback hardware/software has been made for the Atari 8-bit, no matter if it's old/new, commercial/PD..

Anyone know how to make one of those through-your-skin stress detectors? I'd not mind making an 8bit project out of it? (A little bit of hardware through the stick port and some feedback software and you've got yourself a nice little stress-detector... (I'm curious if I can control my stress using cold-hard-factual data))

From: tlivings@freeside.fc.net
Message-ID: <3rntft$g2f@villa.fc.net>
Source record: 90794

I happen to have in my archives a .gif file viewer. In the days of old, I remember getting images from MS-DOS systems and viewing them on the ATARI 8. OF course, images greater than 320x200 were viewed in a virtual screen of sorts, and the number of colours were reduced...

I have an interest in converting some of my .gifs (black and white 320x200) to the Atari 8. I have the .gif viewer, but I don't have the SW to convert the images...

Is anyone familiar with this or such existing software? I may have it somewhere, but right now I am having no luck finding it...

Any help would be appreciated...

_-Todd--

p.s. Would someone please send me, or provide me directions to the source for an uncompressed uudecode file...I seem to be having no luck with mine.... :(thanks for the help...

>Sorry, not gonna pay for what I've already got!

Well, I've been out of this loop for a while, so I wasn't really aware of what existed; just thought I'd ask, and it wasn't even my own idea but my buddy's: he's got a PC-format drive on a Black Box with about six or seven other big HDs, finds that he gets a lot of requests from local Atarians (NOBODY I know has SIO2PC -or- the emulator, they're just going PC) to "move their Atari files onto PC floppies," and when I informed him of the existence of the emulator he just naturally wondered whether there'd be a "market" for a similar service for users of the emulator.

Then there's the whole seeming "jungle" of .XFD and .ATR and .DCM files, whose types and purposes I can never seem to keep straight and the conversion programs between which seem to give a lot of people a lot of trouble. I've had it happen in the past that a homebrewed program of MINE worked better than a buggy-but-released commercial or PD one, and I wondered if I might be able to do it again in what seems to be a bug-and-problem-ridden field at the moment .

I certainly have nothing against the thing being doable already and for free! More power to ya; one of these days I'm gonna break down and buy a PC, and then I will just HAVE to have an SIO2PC and the emulator...

Chris

Aha! See? So there WOULD be an interest! :-) Kit, I'm glad to see you say that. My pal with the hard drives and PC floppy drive will be glad too. The line forms here... ;-)

And hey, since we're using all kinds of different programs to go between all kinds of different file formats, should I expect there to be some interest, someday, in a SINGLE program capable of going from ANY ONE of these to ANY OTHER? And again I ask, should it run on the PC or on the Atari, or on both?

475. Atari 800 emulator for Unix

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-16 00:00:00 UTC
From: David Firth <david@signus.demon.co.uk>
Message-ID: <1995Jun16.025330.221@signus.demon.co.uk>
Source record: 90708
Cross-posted to: comp.sys.atari.8bit,comp.emulators.misc,comp.emulators.announce

```
I have just made available version 0.1.5 of this emulator. It can be
obtained via ftp from ftp.demon.co.uk in the /pub/emulators directory.

Here is the list of changes:-

Changes in 0.1.5
----------------

- CURSES text only mode (Support for various terminals)
- Display list jump instruction corrected.
- Fixed SIO module (It didn't update DSTATS)

Changes in 0.1.4
----------------

- Changed GetByte and PutByte to macros
- Added SVGALIB support for Linux which is much quicker than X11.
- Added support for OSS Super Cartridges (Thanks to Dave Bennett)
- -rom option to specify alternative cartridges
- -oss option to specify alternative OSS Super Cartridges

Changes in 0.1.3
----------------

- Compilation option for double size screen
- Trigger now initialises to not pressed
- Joystick now initialises to central
- Fifth Player support added
- Support for Paddle 0
- Preparation for changing GetByte and PutByte to macros.

Mail me if you have any problems

Call me stupid, but I've been wondering for years about these 256K Atari 8-bit memory upgrades... how is that much memory addressed by a 6502? I conclude that it must be banked somehow, but then the question arises, how do you get off-the-shelf (i.e. pre-existing) software to use the expanded memory? You'd have to intercept every memory reference and somehow determine that it was supposed to go to this bank or that, based on I know not what criteria. How is it accomplished, Ben?

Also, your tale of Thunder Child's overheating-and-screwing-up, particularly the bit about gibberish appearing in the AtariWriter screen, really sounded familiar! Back around 1987 or so :-), I posted here that my then sole Atari, an 800, was beginning to suffer from an intermittent problem that APPEARED to be heat-related: when operated in an ambient temp over about 85 degrees (I grew up without air conditioning), AtariWriter would fail to work, and fail in a peculiar way: at any keystroke, the machine would make the SOUND of MANY keystrokes -- as though key-debouncing had failed badly or something -- and the LEFT HALF of the screen would scroll away to be replaced by whatever "garbage" data was "above it in memory." AtariWriter was the ONLY program affected, but that alone was sufficient to cause me a good deal of mental anguish: "my Atari is dying!" :-(The problem gradually got worse and worse, from an "occasional" thing to "every time the temp is high," but it never affected anything but AtariWriter. I eventually took the computer to a repair shop, who were unable even to reproduce the problem because, of course, the repair room was air-conditioned... They did accomplish one thing, though: they robbed me of the screws that held the case together and, when I called them on it, gave me a handful of screws that turned out to be the wrong ones... Anybody have a set of case screws for an 800? :-) I retell the story here and now, Ben, because we didn't have YOU here in those days and I'm wondering what YOU make of the tale. It sounds, to my uneducated (in hardware) ear, a lot like your experience with the Child -- only the Child got a lot hotter and blew all at once.

Interesting, so very interesting...

Message-ID: <140682@cup.portal.com>
Source record: 90710

Steve; you got me thinking so I pulled out my 1050 field service manual &
looked at the source code listing. Couldn't find any of the cmds you talk
about, but not willing to let it die, I put a Tandon ROM in my eprom burner
& dumped it. Not a single byte matched the source code, arrgghhh! Anyway
there's supposed to be at least two Tandon ROMs that I know of, E & F so
I was probably sold the listing for revision A<g>. Anyway, one of the reasons
the Tandon ROM was revised for the 1050 was because it returned different
values for errors under some forms of copy protection. Ivo seems to have it
cornered but I did a quick list of the command tables for the Tandom &
ICD ROMs
ICD !"PRSWNO?f
Tandon RPWS!"#$
I didn't bother to disassemble the binaries to try & figure out just exactly
what they were doing, but you do seem to be right on as far as undoc'd
commands go. The ones you mentioned aren't in the SD Construction set manual
so maybe I can find my 810 source list & see if it's in there.

>drive and 9 inch monitor didn't take up much space at all. Still more
>that I have room for today though which is why it is in a box in my
>storage space.

Indus GT... that reminds me... I bought a used Indus GT last year w/o
a power supply and am still running it on a supply I'm BORROWING from a
buddy of mine. I'd like to get one of my own and return the borrowed one;
are any of the remaining vendors still selling Indus-GT-compatible power
supplies?

(And speaking of vendors, am I correct in presuming that last winter/spring's
"Atari Closeout" at -- was it Best? Or American Techna-Vision? -- is now
past? I never did get around to ordering anything :-(...)

480. Re: Disk image formats (was: ST Xformer 3.0 with source code)

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-16 00:00:00 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <140684@cup.portal.com>
Source record: 90713

Two more cents' worth of gasoline for the fire:

It's been my observation that the one "gotcha" that eventually bites most disk/file/image/etc. formats in the rear is that they fail to plan for their own enhancement and/or obsolescence. They get to a certain point where a new attribute or capability has been invented which the "old" format didn't anticipate, and they can't cope, and a new format has to be invented and all manner of compatibility-and-conversion issues addressed. We're seeing this at present with ATR <--> XFD <--> DCM etc.

IMHO, the simple solution is to do some forward thinking when defining any new format, and to incorporate some "extensibility" information into said format. EVERY header of EVERY entity expressed within a disk/file/directory/sector/record format -- in short, every header of anything that HAS a header -- should contain the following fields at minimum, in addition to the information describing the disk/file/directory/sector/record itself:

- header type: a code uniquely distinguishing what kind of header this is
- header size: length of the header in bytes; makes it possible to skip a header of a type you don't recognize
- header version and revision: programs use this to decide what features and fields are supported in the header they're looking at, in case it undergoes changes over time
- extension-header pointer: a reference to another header containing additional information. Probably null in V1.0 of any header, but allows you to add new header fields "ad infinitum" as time goes on! Extension headers, of course, have further extension-header pointers...

The beauty of this scheme is that you don't HAVE to anticipate EVERY possibility in V1.0 of any format, because you can add onto it in the future without vast difficulty. You could in theory embed all existing Atari DOS formats into one "meta-DOS" prefixed with a couple of bytes' worth of standardized "meta-header." Ditto all existing image file formats, etc. etc... I'm just surprised that this seems to be such a novel idea, judging from the way things are actually DONE.

What GIF viewer do you have for the Atari? Both APACView and JView XL have built-in `save' features.. Both are available at UMich. Both more-or-less require GTIA graphics (most 8bit Ataris have them). JView XL requires an XL (where you can swap the OS out and use the 16K of RAM `underneath' it)

Yes Chris, up to 4MB can be banked in and out (you lose BASIC banking on/off eventually, but just get a BASIC cart or use TurboBASIC XL (if the software runs under it).. it'll go faster anyways!).

Also, programs like MyDOS's DUP.SYS (the menu) are smart enough to determine (usually) exactly what setup you have! For example, when moving from a 256K (RAMbo) 1200XL to a 256K (Newell) 800XL, the RAM banking used by MyDOS for it's RAMdisk didn't work right.. it was setup for the 1200XL.

All I did was hit [O] for setup and hit [Return] to default every prompt and I got a perfectly-working 192K RAMdisk for the Newell! :) (Then just [H] Write-DOS and I'm set for good!)

k >
k > (4) I'm beginning to think we (or perhaps I? :)) need a c.s.a.8.binaries
k > newsgroup. People like me who post beta releases and demos regularly

Maybe, but to get a new group you have to vote. When voting for a new group
2/3 of the valid votes have to be YES. And, the YES votes have to out number
the No votes by atleast ONE HUNDRED.

Man, if nobody votes NO, and all votes are legal, we'd still have to find
100 people to vote. <scratching behind the ears>

As long as those binaries can be run on a standard Classic Atari, without
requiring additional hard- or software, I don't mind the occasional binary.
But, I do not like lots of "C" code, ACTION! or ML source (they require a
language disk/cart) and I really don't like it, when those files can only be
run on emulators.

Speaking of emulators (since I DO have your attention anyhow) Don't you folks
have anything else to talk about then Xformer and SIO2PC. Yak! Am I the
only die-hard classic ATARI ONLY user? The last of the Ataricans?!?

c >
c >Steve
```

If the 410 is the only hardware he has, with only one SIO port (except the computer itself of course), he should make sure the 410 is the last one in the chain. Most classic ATARi hardware have two ports. As far as I know, only the 410 and XM301 have only one SIO port.

If John Pruitt really needs a SIO splitter, he might find the "ApeFace" at Best Electronics (don't they have them in unassembled as well as assembled form) or the Quintopuss sold and made by CSS. (wait of the FAQ (Vendor/ Developer List) comming by, it's published monthly. If you contact CSS, make sure you use the phone.)

488. MyDOS & Sparta

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-16 00:00:00 UTC
From: mathniss@link.xs4all.nl
Message-ID: <3rssth$vep@link.xs4all.nl>
Source record: 90721

Howdy Folks

Yesterday it happened again. While I booted MyDOS 4.53 off of a disk I rarely use to boot, instead of formatting my RAMdisk, the floppy itself got formatted (well, only the first 10 tracks or 180 sectors of a 1.44 meg floppy)

I guess this happens when you do a Write DOS to disk on a 64kB computer and then after a while boot from this disk on a 130XE. (I guess the 800XE sets the RAMdisk number to zero (as in NOT present), then on the 130XE disk zero is interpretted as being drive ONE. I once knowingly set the RAMdisk number in MyDOS to zero, and after booting off that disk, it got formatted.)

Fortunately the date lost wasn't very important, just some textfiles and DOS & DUP. First I wanted to buy a second 1.44 meg drive, but now I'm thinking, I might as well buy me a hard drive. But... sometimes I have to use SpartaDOS , while I REALLY like MyDOS. So I'd need to "split up" the Hard drive.

Is it possible to use part of a hard drive with MyDOS and the rest with Sparta (3.2)? Both having their own structure on their own partions?
Boot both from hard drive?

(please, NO "Sparta vs. MyDOS" discussions.)

489. MyUtil Woes (again)

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-16 00:00:00 UTC
From: rumpf.1@osu.edu
Message-ID: <rumpf.1-1606951943290001@slip2-20.acs.ohio-state.edu>
Source record: 90722

Okay, I've gotten a bit further in my quest for getting software from the net to my Atari. I've formatted some DS disks with Indus GT Dos and wrote some files to them on a PC using MyUtil. No problem. My Atari read the directory okay. But when trying to run the files, I got read errors on all of them. So: I'm going to format some disks using SpartaDos, thinking maybe a different format will help. But Sparta has *sooooo* many different formats! 35 sector, 40 sector, 77 sector, 80 sector - which should I use? I know to use true Double Density, but does the sector count matter? HELP!

Um, it was deleted, but I it'll be back within a week.

I only have an account on that machine when I'm taking a class in that
department. So I just keep taking computer science classes every
quarter to keep the account. The only problem is that the account
gets deleted at the end of each quarter. So I back it all up before
it's deleted, then as soon as I can login again, I put everything
back.

Summer quarter starts monday, so I should get the account back next
week.

This week I've been reminded of how much I depend on that page being
up, for quick access to stuff I use all the time.

It'll be down again sometime in September.

Bob; Make ABSOLULTELY sure you use DSDD or SSDD disks for the transfer, the 1.2 meg HD type performance is spotty at best & the Atari can't write to it. I usually keep a couple of $5 360k mechanisms around for this type of transfer. A major problem is the heads on high density drives are actually narrower to allow for 80 vs 40 tracks. It's best to sort out a disk that works with your Atari drive for all operations, then format it on the clone with Util & use it from there.
Rick

Where can I get or purchase a copy of Chaos Music Composer?
Is there an english version?

Also, where can I get sourcecode or a routine to load into a program (hopefully self-relocating ;)) to let my own programs play existing CMC files?

Also, with so many CMCs popping up, I'm guessing that either someone has made a CMC extraction program or the authors of the CMC tunes are giving them up as stand alone files? (Although I know someone who extracted the CMCs out of Sweet Illusions demo).

Anyway, I'm not going by word of mouth, picking CMC as a music editor.. it just seems to be the "in-thing"! And >I'd< not mind getting my foot in it.. perhaps (with a player routine.. I have the player program PLAYCMC.COM) I could add existing CMCs to some games to spruce 'em up!? :)

The following are Public Domain 8-bit disks I'm looking for:

Paradox - I never found this game except from C&T. It is a text
and graphix adventure like the first of the Ultima series,
back when the 8-bits still got respect. It plays well even as
primative as it is by today's standards. It was C&T disk #344.

8-Bit Graphix Maker - Was a program in the mold of Envision, but
PD. It was C&T disk #469.

Geneology - Just the thing to shake your family tree. It was one
of the disks that the Mormon Church distributed for a variety of
systems to trace one's roots. It was C&T disk #500.

Adventurer's Companion - A cheat sheet PD program for various popular
text adventures. I may never get the babble fish in my ear again
without it. It was C&T disk #681.

Aftermath - A rich and gothic look at a world following a
nuclear war. It may not be as likely today with no more Soviet
Union. It is C&T disk #371.

The programs I need cracking data are: Atari Planetarium, Movie
Maker from EA, and NATO Commander from Datasoft. Yes, I own the
original disks!

500. HELP!!!

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-16 00:00:00 UTC
From: I.A.Fox@bradford.ac.uk
Message-ID: <3rruhd$j0n@columbia.acc.brad.ac.uk>
Source record: 90801

I am having great difficulties with downloading files from ftp sites and I was wondering if anyone can help me.

I am running a Uniterm program through Kermit and can't find the way to download files. At the moment I can only download .zip files as Uniterm has an unzip function. I was wondering is there anyone out there who can give me step by step instructions as to how to get other files such as .lzh and .arc files down, expanded and running.

I have tried various methods such as downloading CWAC3 but my machine is only a 520 and can't handle it.

If anyone knows where I can get an archiver for .lzh and .arc files and how to expand them I will be very grateful.

Yours in desperation and hope,

Thanks in advance

Ian A Fox

>Is the '@' command directed at some HD interface or time device? Any help
> would be great.

I think it's a so called 'Percom command'. It's not a standard 1050 SIO
command.

>Also, there seem to be alot of undocumented 1050 SIO calls. Ive seen
> alot of them while using the 1050DIAG program. These include
> $23, $24, $FE and a few others. Any ideas?

$23 and $24 are internal diagnoses commands. Can be used to do all sort of
things like moving the head half a track forward and backward, see what's
the rpm etc.etc. I once wrote a small program which formatted a disk twice,
once starting at track -1 and once starting at the normal track 0 position.
Now I could put 26 sectors in front of track 0 which remained there even
after reformatting the disk. Could be used as sopme sort of copy protection,
though I doubt if all drives will recognise the $23 and $24 commands.

Okay, now that I'm firmly back into 8-bit computers, I'm digging out old software from ten years ago - and naturally I'm paranoid about data integrity. I mean, floppies were never meant to last forever, but some of this stuff is irreplaceable (ie Alternate Reality - I LIVE for this game). How can I back these floppies up? I'd prefer a floppy to floppy solution (I don't own a PC)...do Happy drive upgrades allow for backing up protected software? Or is there something better? Or a software solution?

By the way, shouldn't all this be in the FAQ???

I like Chipmunk, which has a database of programs, and patches the
disk to remove the copy protection.

I don't know where you could find it, though, and if the program you
want to copy isn't on the list, you're SOL.

I have two versions, and I've noticed that the later one is missing a
few entries that the earlier one has, so I guess it's not always
helpful to get the latest version.

When I tried to patch one program, I forgot to switch disks before it
did the patch, so Chipmunk patched itself. :-(I still don't know if
it did any damage, and now I forget which disk it was.

The SDCS booklet says you should first use XINIT on a small partition
configured as drive 1 (tell XINIT it's a 40 track SSDD drive, no US),
then use HDINIT on the bigger partition. This is for the Supra hard
disk interface, though.

If that doesn't work, (or maybe even if it does), you might try the
BOOT command, which writes the name of the .DOS file to boot onto the
boot sectors. (e.g. BOOT XC23B.DOS)

Do they have anything for the XF551 drive for copy protection?
Among my favorite games (Electronic Arts has come up with most of them) is Alternate Reality (though I've never had anything but a broken copy of this).

I too am concerned about the life span of my ancient 5.25 disks. I think they're pushing 70 in people years.

I'd love to be able to keep a BROKEN copy of my stuff vacuum sealed at 65 degrees.

cheers,

Z-man (RZabaga@AOL.COM)

Unfortunately, due to copy protection, some of my favorite games might be lost due to just plain age!
So what I'm looking for is this:

Does anybody have a broken copy (binary file version maybe?) of M.U.L.E???

I have the original, but a backup is USELESS because it won't work for beans, due to the fact that Electronic Arts software is copy protected well ! ! ! ! !

I'd be willing to pay for it. really. just a copy. that's it. 1 m.u.l.e. please.

cheers,

RZabaga@AOL.COM

a.k.a. Z-MAN.

>
>Is it possible to use part of a hard drive with MyDOS and the rest with
>Sparta (3.2)? Both having their own structure on their own partions?

That's easy -- infact, it's necessary. The Atari has a limit of 16
megs on one disk, so for any disk bigger than that, you need to split
it into separate partitions. Each partition acts like a separate
disk. It doesn't matter how you format each one -- theoretically, you
could have a Sparta partition, a MyDos partion, a Macintosh partition,
a MS-DOS partition, and a unix partion all on the same hard disk.
(Finding an operationg system to read all those might be a challenge.)

>Boot both from hard drive?

I think the black box and the MIO allow you to specify which
disk/partition to boot from.

>different formats! 35 sector, 40 sector, 77 sector, 80 sector - which
>should I use? I know to use true Double Density, but does the sector
>count matter? HELP!

First you need to remember that you'll need different software on the
PC to read the Sparta disks. Myutil (and Util and Atario) only read
Mydos format. The two programs I know of to read Sparta are SR
(SpartaRead) and (I think) SDATARI.

And for the format, I think you may have meant "track" instead of
"sector" (but then I've been dealing with "cylinders" for too long).
The different numbers of tracks are for different sizes of disks;
5.25" disks use a 40-track format.
(there are 18 sectors per track on normal single and double density
disks, and 26 sectors per track on enhanced density disks.)

If you can't find a Super Archiver, you can fall back to software and get
a product called "Chipmunk". It unprotects quite a bit of the classic
stuff out there. I had a problem with my original Silent Service disk; it
would only boot after three or four tries. I used Chipmunk to copy it onto
a new disk, and it runs first time, every time.

Good luck

Vince

518. Binary Load to Cassette Boot - HOW?

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-17 00:00:00 UTC
From: cecarman@miavx1.acs.muohio.edu
Message-ID: <1995Jun17.034543.46590@miavx1>
Source record: 90740

Okay, I just bought an Atari 400 (for the membrane keyboard, of course), and I want to transfer some of my 800's disk games onto tape so I can use them with the 400's tape drive (realize that this is just for the fun of loading games on tape). Now, my favorite game is Archon, which is in Binary load format (it's an .EXE file), around 180 blocks (of 707). I'm using a program called "The Archiver", which works with the 810 drive I have that has some copying chip installed to break copy protection (it doesn't work too well with newer stuff). In this program is an option to copy from binary load to boot cassette, and I've tried it, but I can't get the thing to reload. I've tried CLOAD, ENTER "C:", LOAD "C:", you name it. All it does is make that hideous scream when a tape isn't loading correctly (you probably load the sound) and gives me one of its ambigious erros (like Channel Already Open). Anyway, I want to know if there's any method in BASIC or DOS that I can use to save this program onto the cassette. Can I BLOAD "D1:ARCHON.EXE" (or whatever the way is, I can look it up) and then SAVE "C:", or is it more complex than that? Any help is greatly appreciated! Later,

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" shareware/freeware/PD developers should also be listed.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, public domain
software/freeware/shareware, (new) commercial software, used (commercial)
```

software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No product can be developed by more than one developer. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information is given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

I collect information for this list from wherever I can find it. While most updates to this list come from you, the user of the list, I'd like to recognize a few of the more prominent sources I use. Current Notes magazine, and their 8-Bit Editor Rick Reaser. Atari Classics magazine, published by Jim Hood and Bob Woolley. And The Atari 8-Bit Omnibus, published by David A. Paterson.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

There are several programs for the PC, including Atario, which can read
Atari 8-bit disks.

Most require that the disks be in double density however.

See the FAQ and the atari.archive.umich.edu ftp site for more information.

521. Specs on DOSes

I'm in the process of writing an integrated Atari <-> PC disk tool and
I need some information on MYDOS and how it handles big partitions. I
think I have information to handle SpartaDOS partitions, but MYDOS
might get tricky.

I'll post more info when it's available. :)

You should look at my 'unix2atr.c' and 'atr2unix.c' programs at:
ftp://ftp.cs.dartmouth.edu/pub/crow/Atari/
They convert .ATR format disk images to ordinary Unix files, and back
(well, mostly back).

MyDos disks are mostly Dos2 compatible, but they use a full two-byte
sector number instead of a file number for each data sector, allowing
$FFFF sectors.

If they need a larger bitmap than is available on sector 360, it uses
sectors 359,358,... for additional data.

MyDos uses an extra bit in the directory status byte to indicate that
a file is a subdirectory, and, I think, another to indicate that the
file doesn't use file numbers (long sector numbers), but I'm a bit
unclear on the details.

Directories are always 8 contigious sectors. If the disk is DD, only
the first 128 bytes of each directory sector is used.

About 1987 I was trying to build a sound digitizer. Just what it sounds like
you are trying to do -- using the same concept it sounds like. :-)
What I was able to work out, delving into Mapping the Atari for weeks, was
that it was not possible to read POTentiometers more often than every other
scanline. Because the Atari just doesn't update it's registers any faster
than that. This seems to work out to about 8-10,000 samples per second. And
I am being approximate in that number. Even turning ANTIC off didn't seem
to help my calculations. I never had a working test-bed to test out the
system, as my own design required a small amount of hardware which I didn't
build after I worked out the solution.

So if you sample from Pot timers, In My Estimation, you won't get much more
than 10k samples/sec. Now if you were to build a sound sampler (or whatever
type of digitizer) on the parallel bus (PBI of the XL's for instance), then
you would have much more bandwidth to work on. But then you get slapped in
the face by the small memory size, and need to look at bank-switching, which
is a different problem. I'm not sure whether bank-switching would even be
fast enough to keep up with your digitizing system... Probably work though.

I wish you luck and hope you are pleased with the product.

Enjoy!

If you can find anything in the magazine that describes how to make a sampling loop, id like to know. Yes, Lashower is the guy who wrote the program. I guess he also described how to make a digitizer. (something I finally figured out on my own!) its actually a simple thing to do. I've had my stereo wired to the computer and it works fine but I guess theres a danger of wrecking your computer too.

So is steve Lashower still an active atarian?

I take it that CMC is one the better music makers. I've still only played around with sound mon. and im extrememly worried that even if I got the player for it working, it would take up alot of processing time. other thing is its not designed to do 16-bit sound but you can change AUDCTL settings in it.

I hav'nt heard from you since you told me you were goin to try the sound maker program I sent. Have you tryed it out yet? what did you think of Madonna?

529. FlickerTerm anomaly?

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-19 00:00:00 UTC
From: ziggy29@rahul.net
Message-ID: <3s2mfr$3bf@hustle.rahul.net>
Source record: 90656

When I'm using the 800 to connect to my ISP, I'm usually using
FlickerTerm, which usually works right, with one exception.

After FlickerTerm is booted and ready to start working, I then type
the AT command to dial the ISP (i.e. "ATDT 5551212"). The problem is this:
Whenever I make a mistake, and have to backspace and re-enter the command,
the modem acts funny. It never connects. In order to connect, I have to
turn the machine and the modem off and then on, reboot and make sure I
enter the AT command correctly the first time.

Has anyone else seen this? And is there anything that can be done
to avoid having this happen?

Source record: 90657

Have you tried just hitting [Return] and then trying it again? Or if that doesn't work, just turning the modem off and then back on?

The backspace character in FT is probably set the ASCII dec.127 instead of ASCII dec.8 .. this is the setting useful for VT100/Unix stuff..
Of course, since I never use FT (don't have a modem interface for my 8bit) I don't know if this really is the problem, BUT it's MY best guess..

From: kendrick@zippy.sonoma.edu
Message-ID: <3s2sdm$qp7@nic-nac.CSU.net>
Source record: 90658

Speaking of digitizing through the PBI (or for that matter the cart) port
and running out of RAM.. why not one of the first things to come out for
the Sweet16+Mars8 combo be a digitization `station'? With the huge amounts
of linear RAM that'll be available (thanks to S16+M8) and the cheap, fast,
easy hard drive space we'll have (thanks to MIO2) we'll have the capacities
to store and retrieve into memory rather large samples of both sound and
video data!

I think what we might need next is CD ROM support! ;)

Also, how about a cheap DAC/ADC cartridge (or addition to the Mars8)
which anyone could have? It could come with a simple sampler/player...
~~~~~~

Oooh.. now I'm starting to drool (and get completely off of the subject)..

<8^P~~ imagine this:

You insert disk 1 into your PC
Load up SIO2PC
Load A:\INSTALL.ATR into drive 2
Turn on your 4MB Atari with Sweet16 and Mars8 (making the 4MB linear)
and VERY large IDE or SCSI hard drive (connected with a BlackBox or
MIO-II)
You load D2:INSTALL.COM onto the Atari and answer the prompts..
After quite a while of loading and decompression onto your HD it asks
for the next disk
You insert disk 2 into your PC and hit a key on the Atari...
... and so on ...
Now it tells you to set your destination partition as the D1: and reboot

Very quickly after reboot appears a 256 color 3D animation of some raytraced
logo along with some digital sound playing (strings or thunder or something)
It then fades out and after a little more loading a digitized movie intro
appears explaining the plot
Then a brilliant 4096 color title screen awaits your command

leave the game ITSELF to your imagination...

a side scroller with parallax scrolling (probably can be done MUCH
more easily with a Sweet16.. fast blockmoves, linear RAM (maybe
use a TON of chsets to be flipped through? ;))

a mystery game where you're trapped in a digitized or ray-traced
haunted house

a fast Star-Raiders like 3D space shoot-em-up (but with a deep plot)
~~~~~~

Well!? When the HELL are Mars8 and MIO-2 coming out!? I WANT THEM NOW! :)

Oh.. sorry 8^) ... anyway... boy, what a digression, huh?

532. Using faster computers for computation

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-19 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3s2tdc$s37@nic-nac.CSU.net>
Source record: 90659

While in the shower (I always have my most profound thoughts (and best ideas for music (NEED MUSIC EDITOR) while in the shower) I thought it would be cool to make a very complicated, very life-like roll playing game.. like Alternate Reality and the like, but with an Ultima point of view (above).. at least for now.. But the number of things I want calculated per move would slow the game to a screeching halt on any plain vanilla 6502-based XL/XE...

Then it struck me... why not use good ol' Zippy, the Sun Unix box I'm on at this very moment.. (note: I didn't think that sentence in the same form that you see it.. so don't worry, I'm not so stuck online that I can't even take a shower without being logged on!)

Anyway.. Zippy, well, he's a FAST machine.. I can convert a DCM into an ATR in an INSTANT (unless don't use the "-q" option, in which case the fact that it has to send me which sector is being worked for EVERY sector REALLY slows everything down.. it's not Zippy's fault, it's that I'm on a 14.4k modem using a computer that can barely keep up with it.. (IBM PS/2))

I can make an index out of my home page (which requires a lot of file I/O!) in about 5 seconds!

I figured keeping track of a large map and a hundred or so enemies and objects wouldn't be too hard and that I could get the data from the Zippy onto the Atari via a modem! The Atari in the meanwhile will return an aknowledge, send any movement information and of course give me, the user, the output..

How's this sound?: 240 bytes (need to be characters which are displayable on a terminal.. so maybe make that about 500) of screen data are needed from the Unix box..

500 characters = 4000 bits.. at 14.4k bps that's less than 1/3rd of a second per frame.. now, you could make it only update things that have changed on the screen (and maybe even saying "scroll left and here's the data to go on the right edge of the screen"), but having such speed differences per frame in a game is uncalled for..

Now, also, different games can be played by simply running different programs on the Unix machine.. need a different font? Well, be sure it's available to the Atari and the Unix machine will say:

"hello, my title is SUCH&SUCH and I require font FONT.FNT"

If the Atari finds it and can load it, it'll say "Ok, ready"
if not it'll say "oops! sorry!" The game will quit and the program on

the Atari will return to a simple terminal mode (or exit to (DOS where
you can load up) some other real terminal like BobTerm/FlickerTerm/IceT)

Anyway, not only THAT, but with some good code, the program (the graphics
and game interface) would be written for any platform (PC, Mac, you name it)

In a way, it's a LITTLE like X-Windows, huh?

Anyway, what do you folks think? Do you Atarians with Unix accounts want
anything like this??!?

533. source for joystick for 800xl

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-19 00:00:00 UTC
From: degroote@tigger.stcloud.msus.edu
Message-ID: <3s2u76$o4e@urvile.MSUS.EDU>
Source record: 90660

Over the weekend my son rediscovered the atari 800xl. After splicing
together a connector it was great to play "River Raid" again. Anyway,
he says that the play value and graphics are worth a new joystick--the
one we have is very marginal. A couple of years ago i investigated the
stores in town and there were none to be found. The question is are there
catalogs for vintage atari products? If so would some kind soul post to
me directly. I am teaching summer school and don't have time to keep up
on the newsgroups. Nick and I would very much appreciate it.
Thanks in advance
David DeGroote

Howdee!

The Antic Sampling Processor [ASP] appeared in the Feb/Mar 1990 issue of Antic Magazine. The source code was probably not included. The 6502 code I used as a basis for writing ASP appeared in the July 1983 issue of Antic Magazine in an article called "Talk Is Cheap." ASP's digitizing circuit was slightly better than the 1983 circuit - a minor improvement was added by two Sound Technicians at Disneyland (I was working there at the time). The whole circuit still probably costs less than $10.00 to build. As far as the July 1983 issue with the 6502 play/record code goes, if you hang out here long enough, someone will come along selling back issue of Antic Magazine.

ASP also features MIDI sample sync if you have a Hybrid Arts MidiMate Interface. ASP had a couple of other silly features like the ability to play a sample backwards, recording multiple samples in RAM, and writing sample values directly to an ANTIC color register to get really funky displays. Unfortunately, I never had the time to add 130XE back switching code for really long samples. By the time ASP was published, I was busy writing AMP for the Atari ST.

If you're interested in checking out ASP, I could probably post the executable to my FTP site. If you have any questions about how it works, just ask... but don't expect a quick response - I haven't looked at it since I wrote it back in 1989. And I'm making no promises that I can still figure out my MAC/65 source code... :)

No. I dont care much for MTV besides I dont even have cable. The picture
I used was from an old GIF I had. Ive also converted a GIF of the moon and
used it for the backround in a shoot-em-up game. One person who played it said
its like space invaders and asteroids in the same game but I can still make
alot more levels in it.

As for that sound maker, Im not even going to bother with it. if I do
anything, it would be to make it save the data but thats it.

Is there a source for technical information on the SIO protocol used
to communicate with the atari 850 interface?

Specifically Im looking for information on how it boots, the code that is
exchanged when the 'handler' downloads, the commands for setting
and checking lines, baud rates, etc, and how concurrent i/o
works.

Whew. :)

Well, any information you can provide would be great. Making printing
work was a simple matter, but Im afraid this will take awhile :)

Oh jeez Tim! I thought I already got back to you on your sound editor!
Sorry! Let's see.. (trying to remember way back then) I think I found
it difficult to figure out and as usual got frustrated.. I'll have to
see if I still have it around (my PC's HD space goes down to 0K whenever
I have a 300K file to DL so it's bye-bye time for low-priority stuff unless
I'm fortunate enough to have some empty floppies around.. inotherwords,
it may have bit the dust).

Have you added anything to it? If so, send it my way and I'll play with it
some more!

Source record: 90669

Loose ramblings: About a year or two ago I had a PBI ADC chip up & running
so I offered to post the plans, but there was no interest. The chip I
chose/software could only do about 4k 8 bit samples/second & the noise
from in the background was something significant. Even after digitizing
the samples, it was limited by Ataris 4 bit<& change> sound reproduction.
Sooo.... I built a stereo 8 bit DAC onto the PBI, but the only guy interested
in this type of stuff at the time was Bill with his 1200XL
Sooo... I built a mono 8 bit DAC along with an RS232 port into a cart
But.... Since the cartridge port doesn't have the !IRQ line & Bill doesn't
want to use timer interupts to sample & some people with more then a
little familiarity with terminal programs, like Itay, have said they
don't believe you can do a lot of interupts & still have time for your
mainline code to run, I started on a ECI version so I could use the !IRQ
line
But... Itay's 130XE has been so heavily modified I'm having trouble finding
free hardware space to add the features I originally planned.
Isn't development wonderful<grin>?
Anyway, I can go either route, cart or PBI for DAC/ADC, but you always
come down to math, 4k samples/second X 10 seconds of sound =>40k of
data which is the most a lot of people can use. 10 seconds of sound isn't
a lot. The way Atari did it with Pokey is probably right for an 8 bit
machine. Interest in this stuff is fine, ebbs & flows. Gumby was a neat
hack, but I really wonder what percentage of us have it installed or use it?
It's amazing what you can do if you want, for instance, I could probably
fit 4 Pokey chips in the cartridge address space, but then I have no desire
to use the thing & it would mean I'd have to disable 4 other atari's.
I'm open to sugguestions, particularly if no one is in a hurry. When/if
I ever figure out how to get Itay's board working I'll probably start on
an 80 column cartridge video board for myself, but after that I may try
to do something of wider interest.

>Are there any Programms available via ftp? (DOS & AmigaOS ?)

There is no such thing as "Atari 800 XL- disks." The 800XL
is a computer, not a disk drive. You need to specify the type
of disk format you're interested in reading (SD, ED, or DD)--if
you don't know, at least specify the type of drive that created
them, and we can hopefully figur it out.

Ivan, for Atari DOS 2.x and MyDOS 4.5x SIO2PC .ATR disk images, the program "S2PC" is what you want. Also "Atarimg" works as well, but unless you have a good graphics card it'll just crash. >:^("Atarimg" might handle SpartaDOS disk images as well..

Finally, if you're on a Unix machine, "atr2unix" will extract all of the files out of a MyDOS disk, including subdirectories and the files/subdirs within them! (And "unix2atr" will do the opposite!) (Also, I'm 99% sure it supports plain DOS 2.x disk images as well, of course!)

Is there any sound editor which produces the kind of music that the Liebich demo has? (Also Cool Emotions and at least one other demo I've seen have it too.)

I'm pretty sure that both GTracker (haven't seen it yet.. now that I have a mulit-part-DCM-to-ATR converter I can finally try it out) and DigiStudio (haven't looked at it in a while) only let you mix and play one digital sound at a time..

These demos, on the other hand, play TWO digital channels at the same time, plus two standard channels.. all four at the same time! (Actually, I'm not sure if Cool Emotions' intro. even plays two digital channels.. I think it's only one!)

Also, not only is the screen ON, but there's a scroller, and in the Liebich demo, two Players which depict what the digital sound is doing, two colored bars which lighten and darked depending on the volume of the standard channels, a bouncing logo, and a menu.. pretty full screen if you ask me!

Are there any music editors which make this yet? Will there be!?

Hi,

I am writing a program on the PC to display a directory and
extract files from Atari DOS disk images (useful for uploading
.COM files from my PC)

Any idea what the first of the last 3 bytes of every sector
represent?

FYI:
2nd to last byte = Next sector number for this file.
Last byte = Number of bytes used within this sector.

Alternatively, does anyone know of a program already written
that will do what I want?

Thanks

Ivan

Stephen; absolutely, positively, you've either wired the MAX232 chip wrong or you've got a bad one. I've never seen one that far off voltage without something being wrong. Does the computer boot properly? Are you sure you've got the right orientation for the plug? I've used plugs from several manufacturers & the only differences I've found are
1) What Nick says is black for Atari ground is usually bare wire shield ground. The logic ground, pin #4 I believe is always black. Those two should let you if you have the pin-out right.
2) The violet is light green on Chelco<sp?> manufactured cables. Everything else I've seen is accurate. Something else that may help pinpoint you problem is if you're using a 1200XL computer.
BTW: If you give up the ghost on the MAX232, I have a version that just uses a 74LS00 or a cmos 4049 that will work with a 1200 for sure.

As I know sector 1024 contains the VTOC of whole disk. The first part of
this sector is identical to the sector $168 (for compatibility reasons).

So, while we are on the subject, does anyone know the meaning of the first
byte of the MyDOS VTOC. I suppose it contains the number of additional
VTOC sectors + 2 for big discs, am I right ?

You can get it from LK Avalon:
L.K. Avalon
PO BOX 66
35-959 Rzeszow 2
Poland

and probably from Mirage Software (I am not sure about it.)
Mirage / AS
ul. Gen. Abrahama 4
03-982 Warsaw
Poland
tel: 671-77-77
FAX: 671-76-22

I don't know whether they have english version of the documentation, the
software itself has english descriptions.

There are some examples of .CMC files on the distribution disk as well as
simple BASIC program demonstrating how to use CMC modules in your own
games.

Try holding down START while you turn on the computer! (with all cartridges
removed) after hearing the BEEP press PLAY on the tape (assuming the tape
is in the correct position) and then press RETURN on the keyboard to start
loading the game.
The game will load and run automatically (assuming the boot tape you made
works!)
The same is true for XL/XE series machines except you hold down OPTION and
START (to disable the inbuilt basic)
Hope this helps!

>

[Missed the original post]

I think that sounds like what a program called BackUp Master does, as well.
It used to read the entire boot disk with some various toggles for something,
wrote an 'image' or some bootup system to a new disk, then you needed a normal
sector copy of the original disk after the program booted and was past the
copy-protection scheme.

Anyone remember BACKUP MASTER? I have v3.0.

Enjoy!

Hello,

I am having trouble building an SIO2PC cable. I am working with a friend to build it. He is an engineer at the company I work for and is very good with electronics, so I think he is capable. The company builds PC internal and external modems, etc. We are building boards and soldering stuff all the time.

I am trying to build the MAX232 one chip version of the SIO2PC cable. The problem is that the directions are relatively confusing. I am using the DB25 connector for the PC end and the standard MOLEX cable for the Atari. In terms of pinouts and wire colors, things get confusing.

The colors listed in the text files do not match every listed Atari cable pinout. We tested the connections and went by what pin were connected to what wire, instead of using colors. For the PC end, we also went by the tested connections, not colors. I used the chart in the text file to convert the DB9 pinouts to the DB25 pinouts, but its show 5 pinouts used, even though the cable only seems to use 4 of them There is pin that shows a conversion from DB9 to DB25, but it is not used. It is pin #7 on a DB9 and pin #4 on a DB25. It is not used according to the design.

We tried the various voltage tests and voltages were way off. Where there should be +9 volts, there was -3 volts. We changed one thing, then got +3 for that pinout.

Can anyone please email the connections that need to be made, both Atari and PC. I just need to know what pins are connected to what. I am using the DB25 connector for the PC. I have the text file instructions that came with my PCXformer 3.01, but I am not sure they are right.

I would like to email the original designer of the cable, but I do not have his email address or remember his name.

Please help!!!!!!!!!!!1

Thanks,

Stephen Buechler

: ??

: Can anyone post me Sparta Dos as a DCM diskimage File ?

Hello! If you have FTP access, then SpartaDOS 3.2f & g can be found at
the UMICH archives as well as it's many mirrors. It is Shareware from
Fine Tooned Engineering.

As for it's popularity, that is debatable. But many DO use it and it is
very popular amongst hard-drive and BBS operators because of it's power.
A file with a .scp extender is probably a SCOPEd disk. That's a utility
that is used with SpartaDOS. Similar to .dcm . I also think that version
3.2f is available on a B side of a Top Magazin disk.

Liebich.com is at both Xmission (where I got it) and Umich (where I put it)

Also, FYI, I checked out the GTracker demo and, although side 1 leaves quite
a bit to hope for, side 2 is actually quite impressive! It DOES sound
like at LEAST 2 digital audio channels playing at once! Is this correct???

574. XE looses Hlock when warm. U8 bad. Now what?

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-20 00:00:00 UTC
From: rrolf@ee.ualberta.ca
Message-ID: <3s5o2b$g9u@rover.ucs.ualberta.ca>
Source record: 90613

I picked up an XE with Keyboard, gun, and joystick at a garage sale
for $5.00.
It works for the first couple of minutes (just long enough to get my
4 yr old hooked on missile command) and then the background looses
horizontal lock, but the sprites remain OK.

Since I'm a good hardware type I determined that U8 was flaky, but the
symptoms are not a 'binary' failure, but rather a VCO that has drifted off
center, and can't be pulled back. I loaded every pin with my fingers, but
could not affect the display, so I suspect that the PLL is totally internal
and defective.

SO, is it worth fixing to have a simple entertainment option for my kid,
or should I just trash bin it?

Also, is there an equivalent to a memory Peek or Poke command in the
Basic that loads when the keyboard is attached? I figure I could scan
the ROMs to find the keywords that basic is using to get a handle on
whats possible for commands.

Thanks in advance for any suggestions or pointers to a solution.

If it's a chip, you can get it pretty cheap from BEST Electronics
(see the Vendors/Developers part of the Official Comp.sys.atari.8bit FAQ).

If you need PEEK and POKE, yep, they're there in internal BASIC:

```
POKE 123,456
PRINT PEEK(789)
```

If you ever want to get a disk drive... and happen to have a PC/clone,
get a hold of SIO2PC.. the software for the PC and the information on
building the cable are available at
ftp://atari.archive.umich.edu/atari/8bit/Sio2pc
with it, you can have up to 4 disk drives at a time handled by the PC,
each numbered from 1 to 8 and being of any size up to 16MB.

Of course, if you need to access real floppies, you'll need a real disk
drive (unless the disks are Double Density (rare for commercial products!)
and you have a certain type of 5.25" drive on your PC).

As for getting software (cartridge or otherwise) or hardware, again, check
the monthly-posted comp.sys.atari.8bit FAQ pt.2: Vendors/Developers.

If you need general help with the Atari 8-bit, both pt.1 of the FAQ and
my Unofficial Atari 8-bit New User, Emulator Help FAQ will help you to
get [re]started with the 8-bit (and as the name implies, mine also helps
you with using emulators).

Rick:
interesting! four pokeys on a cart.
I knew a guy who did the stereo XL thing but I would'nt get into any mf them
types of HW hacks. Its not my thing but Ive installed a few mee upgrades.
im more into programming.

Steve Lashower:
I dont see why you need a digitizer. I just put stereo output to the POT
you read in ASP and it sounds ok to me. (ok for what id expect it to sound like
it is'nt real great) someone else told me it was risky
but if I wreck the ADC for POT2, ill use the next one. Im still not quite
over just being able to do sampling period.
Hey, that backmask feature was a great idea. as I wanted to do for a long
time, I sampled a back masked message from an Iron Maiden tape I got
(I fliped vhe tape over to hear it last time, but that was'nt smart) but
playine it backwards I find its still in another language anf all I can make
out is the burp at the end. Also, when I got the playgr there were two that
came with it from a pink floyd and led zeppelin song.
If you could tell me how you did the sampling that would be fine
or just post the source code). Did you use a timer interupt?
here is basicly how I did it:

```
DO loop start
POTGO=0; Action code for setting registers.
SKCTN=4

STAabs WSYNC
STAabs WSYNC
LDAabs POT0
ORA 16 ;SET VOL. ONLY BIT
STAabs AUDC0

SKCTL=0

OD Loop end
```

This is'nt actually it because my RD messed up and I did'nt save it.
Im not sertain where you should set bit two or do a POTGO(Does it matter what
value you use?) but I tried it in all variations.

Bill V, McBrine:
I tryed delaying it with WSYNCs and even a fast PRINT.
It still does'nt work. If it works in ASP, there is a way to do it.
10k/sec. is'nt all that bad. I think ASP does it even slower.
The banking I would'nt see being hard at all. With my
1 meg I figure I could get about a 3.15 min. sample at the speed ASP samples
in. You would use 14 bits of a pointer for the $4000-7FFF area and 5 more

for the banking. It could be alittle slower though depending on how

[Stuff Deleted]

It sounds like a pretty cool idea!! It should be extended to being
a networked game, where others could play too!! (A simple way to try
this out would be to make a graphical front end to a MUD. The Atari
would intercept information from the host, and pretty it up!! You
would be able to use the joystick to move, the keyboard to type, etc)

It reminds me of Air Warrior on GEnie, but I don't know how much of
the processing was on the home computer end, and how much was at GEnie
itself.

I would have to go with the following for the Top 5;

1. Draconus
2. Shadow World
3. Mercenary (I or II)
4. Space Beagle
5. F-15 Strike Eagle

Thus far, Draconus, is the only game I have ever seen that pushes the limits of what the 8-bit can do, more than any other game. It is equal to the NES, which is saying a lot considering the NES was designed as only a game machine, not a computer.

Shadow World has a horizontal independant split screen, which has not been successfully matched as yet by any computer/game platform to date.

585. Help request again, null modem

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-20 00:00:00 UTC
From: wcm1@cornell.edu
Message-ID: <wcm1-200695104257@128.84.239.122>
Source record: 90693

I need to transfer files from Atari 8 bit onto Macintosh readable discs
to salvage several years of accumulated work. Of highest priority are
AtariWriter files, text only, but Data Perfect and Atari Filing Manager
data files are also of interest. I have previously accomplished text file
transfers by modem over Ma Bell's landlines but in the present case
simplicity indicates a null modem transfer.
The Macintosh end of the transfer will be handled by an SE, running the
serial tool of the communications module of Claris Works The SE has ample
additional RAM and hard drive space for the transaction, and from the
software standpoint appears ready to accept data transfer.
The Atari end of the transfer is a 130xe with two disc drives and three
options for communications software, Kermit, 212 Express, and GoldCard.
Using Gold Card, I've been able to get indications of a connection, load
the data buffer and inititate a transfer, but the files do not arrive in
the SE's capture buffer.
The physical cable connections appear to be the problem. I have tried a
number of configurations with a variety of degrees of unsuccess. Anyone
have an informed recommendation?

```
Macintosh DB-8 serial
Pin Function designation color
shell shield ground foil braid
1 output handshake red
2 input handshake orange
3 transmit data minus green
4 signal ground yellow
5 recieve data minus black
6 transmit data plus brown ground
7 general purpose input blue
8 recieve data plus white ground

Atari 8 bit DB-13 serial
1 clock input brown
2 clock output pink
3 data input orange
4 signal ground black
5 data output dark green
6 shield ground bare wire
7 command light green
8 motor control yellow No connection?
9 proceed light blue
10 + 5.0 v dc/ ready dark blue
11 audio input white carrier detect?
12 + 12 v dc red
```

13 interupt grey

I&#65533;m aware that wire colors may vary with different production runs of the cables, so that column of the table is irrelevant for you.
I have tried a number of user groups for information to solve this transfer problem, and have discovered that quite a few people need the solution. We are aware that officially Atari does not want to further support 8 bit users, but this should be a very simple problem whose solution is probably just a couple of minutes work for someone. Has anyone gotten this connection to work?

Hehe.. Bertrand, you would put FREE at the top of your list!!! ;)

HEY! Have you see Sexmisja? (No, nothing to do with sex (I know, I was disappointed too... err.. I mean uhh..))

It's a lot like FREE I think, in Polish.. I can almost wanter around correctly.. very good graphics (much smaller "viewport" than FREE, but the commands are available while the "viewport" is on the screen.. in fact, you point at things on the screen to select them / move / etc.)

I a'course DELeted it since I'm no expert at Polish, and also not that much of an adventure gamer, but for those who care, I'd put it up there in the ranks with FREE (.. you know, ABOVE the ranks of most of the other older adventure games (esp. the BASIC ones <shudder!!!>))

If you like Shadow World, you'll like Cavelords. COOL game!! I like it
a lot!

As for Draconus, if you like IT, you'll like their other game of matching
quality (and almost identical graphics engine, AND it scrolls!): Zybex..

IMO, Draconus is not even CLOSE to "pushing the limits" of the Atari 8bit..
If you seriously think that, you haven't seen some of the high quality
demos like: (no particular order)

Sweet Illusions
Bitter Reality
Liebich
Cool Emotions
Intel Outside

Some of THOSE push the limits pretty far! (And most of the time, even if
they aren't pushing limits, they're still quite impressive!)

So.. where's the Halle 1995 demo!?!?!?

: 1. Draconus
: 2. Shadow World
: 3. Mercenary (I or II)
: 4. Space Beagle
: 5. F-15 Strike Eagle

Well are we going for Hitech or playability..Hmmm I think the Play side is far more important..

So:-
1. Jumpman
2. Bandits
3. Way out
4. Fractulus
5. Star raiders

Though a top five I would find it hard to pick the top dog of them..
Jumpman, Well its THE platform Game, Stick graphics but TOP playability..
Bandits was a great little shootem up. Looked good sounded good, not bad for an Apple port..

As far as maze games go, way out was the 1st? as still the best, great fun.
Rescue on Frac...Classic!! and last but not least Star raiders still a tremendous bit of software..

Thats the tip of the iceberg, who remembers pitfall, hero, necromancer, bruce lee, conan, preppie, lode runner, bounty bob & pharoahs curse...Great games..

The program S2PC.EXE included with PC Xformer 3.0x does exactly that.
It is freeware as far as I know, and you can obtain the latest copies
(and probably source code) from it author at tgreen@iastate.edu.

I would also highly recommend getting your hands on some form of
documnetation for the Atari, whether De Re or whatever. Most of these
books describe the format of Atari DOS 2.0 disks. It's a better way to
go than trying to reverse engineer the format when the information
has been readily available for 15 years. I can fax you the relevant
page or two if necessary.

Contact Bob Puff or Charles Marslett (don't have their email addresses
handy) about the format of MyDOS disks, and contact Mike Hohman at
Fine Tooned about the SpartaDOS format.

I don't believe anyone has actually written a utility that can extract
all 3 formats, so there is a cool goal to try for.

593. nir-PAL and Sweet16

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-20 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3s7cb8$1vd@nic-nac.CSU.net>
Source record: 90701

I'm sure nobody knows yet, but just in case...

Do the nir-PAL upgrade and Sweet16 CPU upgrade work together alright?
I'm planning on getting both.. but I have this feeling I'll have to
get them put in two different machines (versus two same machines har har)

Also, I'm STILL pondering over Sweet16's large-linear-RAM capabilities..
obviously only the CPU will be able to access the >64K RAM, right?
ANTIC will be stuck within 64K?

Although, now that I think of it, the CPU can do all it needs to out in the
>64K realm while ANTIC gets a whole 64K (err..62K? or 48K w/OS to play with
at any given time.. and then with the 65816's move-block command one can
quite quickly dump other stuff from the >64K area into the 64K area.

Inotherwords, if we wanted to say, animate a set of 64x96x16 images, that's
about 3K per image, let's bump it up to 4K to compinsate for ANTIC's 4K
boundery problem, that's 12 images within the 48K. The player routine
and other images would be stored in the >64K area. The code would be,
more or less:

```
for aa=0 to 9
for a=0 to 11
point antic to ( a * 4096 + starting_offset )
next a
move ( 49152 ) bytes from ( 65536 + 49152 * aa ) to ( starting_offest )
next aa
```

that's 12 frames * 10 sets-of-12-frames .. that's 120 frames!

And it only took: 480 K !!! :)

Hey.. how fast can 480K be loaded into an Atari using a hard drive? ;)

From the WDC data sheet:

FD1771 status after type I commands (Restore, Seek, Step):
bit 7: Not ready (high order bit)
bit 6: Write protected
bit 5: Head loaded
bit 4: Seek error
bit 3: CRC error
bit 2: Track 0
bit 1: Index
bit 0: Busy

FD1771 status after type II and type III commands (i.e. reads and writes):
bit 7: Not ready
bits 6 and 5: Record type from data address mark (after read command)
bit 6: write protect (after write/write track command)
bit 5: write fault
bit 4: record not found
bit 3: CRC error
bit 2: Lost data
bit 1: Data Request
bit 0: Busy

>connected to what wire, instead of using colors. For the PC end, we
>also went by the tested connections, not colors.

I just built one, and it works. On the Atari connector, instead of using wire colors, use the pin numbers. The numbering is...

Looking at the ->Back<- of the Atari connector with the longer row on top, pin 1 is upper right, pin 2 is lower right, pin 3 is next in from upper right, etc. They go upper, lower, upper, lower. Also, use the pin numbers on the RS-232 end.

Atari connector from rear-

13 11 9 7 5 3 1

12 10 8 6 4 2

25 D connectors are numbered on the connector.
I have built quite a number of projects with Max-232 chips, and I haven't found a bad one yet that I didn't blow myself. The capacitors used should be 1uf 25v on modern versions of this chip.

Be aware that the SIO connection on the Atari is not a normal serial port. The levels are TTL (+5 volts or ground) and the software would need to be able to handle the commends that get sent out to it. The SIO2PC program does this, but I don't know of any others.

The easiest way to get this to work is to find an 850 interface box. It will turn the TTL signals into RS-232 and also format the data so that you can use a terminal program. Be sure to get the technical and users manuals with the 850. The pinouts Atari used are different from the normal RS-232 that we see today. Then you can build your null modem and have it work with standard software on both ends.

Subject: was: Re: Emulating copy protection (was...)
To: Atari8@netcom.com

There was another, called Backup Master from Reeve Software, but it never worked well. The good thing was that it didn't require any special hardware.

I have a copy (original), and it creates a two disk scheme that reads the copy protection, and creates a loader file for the second disk with all the data.
I had a 1050 happy drive at the time, so I didn't use it very much...

Craig

(BTW: The happy mod finally beat my tandon drive mech to death with that 'dentist's drill' speed. It made a horrible grinding noise when moving the heads around on every drive I ever put it in.)

C

I think you're referring to a product from Happy Computing :). I can't remember what the product was called, but it was *real*good* at copying almost anything. The guy who ran Happy was a real hacker (in the good old sense), and would update his product as fast as they came out with new C.P. schemes. He later did some system software and hardware mods for 800s and 810s that greatly increased the SIO speed (instead of beep beep beep it sounded like a dentist drill!)

I wonder whatever became of him.

Looking at the switches from the rear of drives (Both are the same).
DRIVE # 1: both switches to the LEFT.
DRIVE # 2: first switch (black) to the RIGHT (white switch still to the left).
Sounds like you've had the SIO cables on and off quite a lot. First
better make sure each one will work individually, BOOT as drive # 1 with nothing
else connected to the SIO. The CA 3086 chips used on the SIO interface don't
take kindly to the cable being removed or installed with power on.

Hey-hey, chalk me up as ANOTHER Atari-only user -- at least, where running Atari programs is concerned! I mean, I have an Amiga, and a couple of ancient PCs that I rarely ever even power up, but I don't do Atari stuff on THEM, I do it on my Atari! Or should I say AtariS -- I have six or seven of 'em stashed around here and there, including the two I just bought (used of course) back in May... I could use a few more disk drives, BTW, if anybody wants to sell some!

I -am- starting to become concerned about the lifespan of disks, though, as recently discussed here, so am now starting to think about ways of archiving (and thereby "refreshing" through rewriting) my HUNDREDS of Atari 8-bit 5.25" floppy disks. Suggestions?

Well, no matter what some people may think, SIO2PC is running a real Atari, you just use the PC as a disk drive. Chris, IMO: SIO2PC is the best way to go for backing stuff up. I suffered a major heart break this winter when my roof leaked onto some of my disks. I'm thinking the 200-300 disks I have would fit on a couple 1.44 megs disks if I only moved the files I actually use. Let's face it, I won't be using AMODEM 4.2 for the 1030 much anymore.

Once again the claim that ZIP disks are 100MB unformatted. I have never seen a rating for unformatted capacity from IOMEGA. What I do see when I run a DOS CHKDSK on my ZIP drive is 100,431,872 bytes. That's 100 megabytes by most disk vendors' standard practice of using DECIMAL megabytes.

[NOTE: BTW AFAIK FYI ISP IMNSHO ASAP B --> InterNet Service Provider
'Gads! "modem" may have entered the language, but ISP ?
...or do those companies mean "InterNet Self-Promotion" ?]

What type of modem ? What type of modem interface ? If you are using
a Hayes compatible modem, then what is the value your S5 register holds ?
(i.e. ASCII backspace value). Has anyone seen this ? Sure I have seen
this. Some modems allow you to type a BACKSPACE or a DELETE character in
order to ABORT what has been previously typed (since typing CONTROL-C might
get the attention of the computer, but not the modem). There usually is no
need to reboot. You merely enter a CONTROL-M/CONTROL-J and then type an
"AT" (enter attention mode) query. Your response would be either "ERROR", or
"OK". If the response is "ERROR", type another "AT" and wait for an "OK".
Once you are at an "OK" prompt, that means that the modem command buffer
has been cleared and you can retype the line. ("OK" is the modem's version
of a BASIC "READY".)

Usually, if your modem gets hungup, there is no reason to reboot the
entire machine. You can reboot the modem. Entering "ATZ" will do a "warm
boot", or you can cycle the modem power switch to "cold boot" your modem.
Having your modem stuck in a typo is a very common occurrence. I do it at
least twice a day. It is not a big deal, and there is certainly no need
for you to reboot your machine (unless the "R:" handler has been messed
up).

617. Directory structures + ADIR

Hi,

Thanks to everyone that gave me help with Atari DOS2.x
directory structure. I wanted the information so that
I could view the contents of and extract files from
.ATR and .XFD disk images.

I have written a program to do this called ADIR.EXE
and uploaded it to jeking's site. The program does
exactly what I wanted if for but is limited to
running under MSDOS and viewing Atari DOS2.x/MyDos4.5
single/enhanced density disk images.

I will supply the C source if anyone wishes to modify
it for their own purposes.

Message-ID: <1829AE84815@east-01.novell.leeds.ac.uk>
Source record: 90640

I can confirm that Gtracker only allows one digitised channel to be played at once, but it can play back in pseudo-stereo, ie use either or both of the left/right channels with a Gumby compatible stereo upgraded machine. The demo on the archives at Umich is mono only I'm afraid. I should know, I am the official distributer for the software.

I also happen to know the author is working on an XE version of the software that will (hopefully) allow two (or more) digital channels of playback. I say XE version because to be effective you really need more than 64k of memory.

Onto something completely different, Draconus is a great game, and I believe it does push the 8-bit Atari to near its limits. Bill (and others) I would imagine you know that programming a game with user interactions etc is a lot different from programming a demo where you can tightly time and control all the on-screen action and not have to worry about what direction the joystick is being pushed, what has just collided with what etc. Sure demos like Sweet Illusions and Cool Emotion have some great graphics, but Draconus is pretty snazzy too and it has some amazing music which is often ripped off and used in demos anyway!!!!!!! These comments are not intended too offend anybody, they're just my personal point of view!

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (280-some rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC

for PC to Atari transfers.

I used the UTIL program some years ago with a 360k drive, with pretty good results. Most disks would read eventually, but some sectors did require a fair number of retries.

:
: Is this the famous EAMON game from the APPLE-II that had about six
: hundred player modules and a fan club ? How is it ?

Yes, this is a port of EAMON from the Apple-II version.

Being that Atari BASIC has no string arrays, the code is not identical.
However, it plays and works the same as the Apple version. In fact I
duplicated everything verbatim, right down to the address of the Apple
EAMON fan club.

: Who did the conversion for the ATARI 8-bit ? Are modules interchangable ?

I did the conversion several years ago. If you mean modules for the Apple,
no, they will not work directly. I did, however, port the Dungeon Designer
(a program that allows users to write their own EAMON adventures)
and one adventure - the Death Star. The Dungeon Designer was rough - in fact
I can't quite remember to what degree it worked. If there is interest, I will
gladly make .DCM files out of them both and upload to xmission.

Have fun!

Dan, the Eamon DCM doesn't boot properly. I loaded it under MyDOS and ran it ("RUN "D:HELLO"") from my RAMdisk and it seemed to work ok for quite a while.

At one point, however, when I got to "1. Go on an adventure", it gave me an out of memory error at line 20000-and-something (one where there's a DIM V(26) command).

So, I tried it from TurboBASIC XL and it ran the same (faster of course) and (since TBXL also has more free RAM) it DIDN'T give me the out of memory (ERROR 2) error, BUT it eventually, around the same place, gave me a "TRUNC" error.. <:^(

Hello out there.

Just a couple of quick questions if any one can help.

Do you remember the games on the Atari 8bits called:
Alternate Reality. The City and The Dungeon.

I had hours fo fun on these games and still own a Atari 130xe and two 1050
disk drives for this reason.

So my question is this what happened to Philip Price the writer of these games
they were so advanced for the time that they were released aprox 1986-8.

Also (sorry second Question) can you get an emulator for the pc that will
run these games and mule

I know they came out on the Amiga but the British version was tottaly pathetic
compard to the Atari.Also they were not writen by him.
Sorry I forgot to mention he did not write the dungeon game.

This question has been with me for years I hope someone can help me

626. 8-bit games????

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-22 00:00:00 UTC
From: ckormos@delphi.com
Message-ID: <526fOxN.ckormos@delphi.com>
Source record: 90648

alleged 8-bit game titles?
Roklan - Eyes(?), Rockball
Mindscape - Rambo
Datasoft - Fathoms 40, Gumby, Heckle & Jeckle
Datamost - Bilestoad, Mating Zone
CBS/Coleco - Timebound, Lightwaves, Murder by the Dozen, Omega Race, Superfox,
Domino Man
Sublogic - Jet, Ghostly Manor
Sirius - Critical Mass, Alien, Beany Bopper, Deadly Duck, Megaforce
First Star - Cosmic Squeeze, Rentwars
Activision - Little Computer People
Sierra - Creepy Corridors, Sammy Lightfoot
Access - Tenth Frame
Gamestar - On Court Tennis
Microlab - Dino Eggs, The Heist, Death in the Caribbean
Synapes - Slamball, Reptilean, TNT, Flamelords
Microprose Gunship, Acrojet
Epyx - Winter Games

ALso rumored....Since there is an adapter on th 5200 to play 2600 games-
and a 5200 is 90% a 400 computer-
where is the XE/XL adapter to play 2600 games?

As much as I can recall, when I said i'd heard he was programming mainframes
he replied it was mostly mid size computers for the defense department.
B2 bomber & all that. He also said he was serving on a C standardization
commitee or something to that effect. I also mentioned that I heard he
had moved on from Atari & he said that was true. Some people within
the sig doubted it was really him, but he seemed just about quirky
enough to convince me it was really him. I forgot all the offers he made,
stuff like music from the AR series that had never been published, etcetera,
but he never got around to delivering it. Seemed to be to busy to even
bother setting up an 8 bit system to get the files transfered, but then
I'd also heard he had dumped everything. I made him an offer for all his
old programming disks since he said he wanted to dump those also, but he
never responded.

: To: Atari8@netcom.com

: While in the shower (I always have my most profound thoughts (and best
: ...
: Anyway, what do you folks think? Do you Atarians with Unix accounts want
: anything like this??!?

Um, not really... I'd rather see high-quality games for SVGAlib under
linux, for example.

Not that using a unix box in conjunction with an 8-bit is such a bad idea.
Here's my wish list for such stuff:

- a GIF & JPEG to colorview conversion program for unix
- a way to use unix printer spooling from the 8-bit
- SLIP for the 8-bit
- patches to xpaint to handle 8-bit graphics modes (funny shaped pixels and
reduced palettes)

Now if someone would only do a port of microemacs (or NotGNU emacs) to the
8-bit...

632. Question about XF v.2.5

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-22 00:00:00 UTC
From: madaras@kosice.upjs.sk
Message-ID: <3sb9qo$6i5@ccnews.ke.sanet.sk>
Source record: 90654

I have the following question:

having PC Xformer version 2.5, I'd like to turn off internal
clickin-squeeking of keyboard, which disturbs me much. I can turn it off
from Basic, poking POKE 731,1, but I'd like to have it automatically
after running XF after pseudo-boot process. I tried to write short
AUTORUN.SYS with code turning off the buzzer, but it seems it doesn't
turn off. I have disk image with MYDOS 4.50.

I'll be thankful for any suggestions.

The 8-bit can outperform the NES any day :)

> Shadow World has a horizontal independant split screen, which has not been
> successfully matched as yet by any computer/game platform to date.

Actually, Sega did it with Toejam & Earl and Sonic 2 and 3, and Nintendo
just did it with Uni-racers. But Atari has done it, by far, the best.
All of teh other games tend to 'squish' the graphics when they're in
a split screen.

Message-ID: <3sdvr7$6ak@ztivax.zfe.siemens.de>
Source record: 90558

: Well are we going for Hitech or playability..Hmmm I think the Play side is far
: more important..

: So:-
: 1. Jumpman
: 2. Bandits
: 3. Way out
: 4. Fractulus
: 5. Star raiders

: Though a top five I would find it hard to pick the top dog of them..
: Jumpman, Well its THE platform Game, Stick graphics but TOP playability..
: Bandits was a great little shootem up. Looked good sounded good, not bad for an
: Apple port..

: As far as maze games go, way out was the 1st? as still the best, great fun.
: Rescue on Frac...Classic!! and last but not least Star raiders still a
: tremendous bit of software..

: Thats the tip of the iceberg, who remembers pitfall, hero, necromancer, bruce
: lee, conan, preppie, lode runner, bounty bob & pharoahs curse...Great games..

1. Wizard of Wor (ROKLAN/CBS) (best two player game ever, on
any platform; lots a bugs that
made it even more fun !)
2. Rallye Speedway (Aventure Int'l) (another great two player
game)
3. Star Raiders (a classic and only 8K)
4. Repton (outstanding defender clone)
5. Gyruss (simply forget Tempest)

Other great stuff: Gumball, Drol, Ballblazer, Karateka,
Capture the Flag, Rails West, Computer Ambush, Mask of the Sun
Operation Whirlwind, Serpentine, MULE, Davids Midnight Magic,
Bounty Bob, Mr. Do

BTW, you mentioned Bandits. I have my original copy dating back
to 1983 here and of course can back it up using the happy
enhancement. But did anyone ever suuceed to unprotect this for use
this PC Xformer ? Does it work with PC Xformer ? Should not be do
difficult as it is an apple port.

Frank-Oliver

I'm working on such a tool for a long long time :)
I just haven't got too much time to spend on it, but now I hope that
the preliminary verssion of the tool will be ready in about month or two.
As soon as I finish it I will make it available at umich and xmission.
It's a little bit similar to Norton Commander and I've named it
Alladin - All ATARI Disk Image Navigator ;)

The program supports:

ATRs - all sizes, read/write
XFDs - standard SD, ED, DD, r/w
DCMs - standard SD, ED, DD, read only (in current version)

My top five games on the 8bit.....

1. Loderunner
2. Boulderdash
3. Alternate Reality
4. Mule
5. 7 Cities of Gold

I've got lots more, and I haven't played them is a LONG time, but they are the tops for me. I especially liked building my own screens for Loderunner and Boulderdash (via the construction set).

Source record: 90564

```
Uhmm. I see that crc16v09.arc and crc16v10.arc from umich and xmission
might come in handy for some people, like, if they could get someone
with a good copy of a dcm to give them the checksum. I can tell you
BobTerm adds stuff to the end of a file and that AtarZmodem doesn't
corrupt the file. So here's my request, if possible.
If Mr. King and anyone at umich (like J. Lenn maybe) could delete
crc16v09.arc and crc16v10.arc and just leave crc16v20.arc, it might
prevent some headaches, as crc16v20 gives the correct crc16 value and
includes an IBM crc16 that gives the same value. The earlier (.09 and
1.0) crc16 DO NOT give the same crc16 as crc16v20.arc. This comes from
a rush to publish.

Source record: 90567

Yesterday, I bought an Atari 800XL, a color monitor, 4 disk drives, an atari printer, and 3 atariwriter cartridges and a bunch of misc disks for $6.00 at a school auction. I'm happy about it. It brings back memories of when I used to be quite a basic programmer for the 800XL I used to have. I'm trying to load some software from my old cassette player, but I forget what I need to do to boot the computer so it gives me that long buzzing sound before I start the tape player. I know I have to hold down at least 2 function buttons when I turn the 800's power on, but I can't remember which 2. Can anyone help me? Please e-mail me. Thanks,

Steve H

In article <DAMuo3.IqK@boss.cs.ohiou.edu>,
Steven Harris <sharris@bobcat.ent.ohiou.edu> wrote:
>Is DOS just like MS-DOS for PCs?

Not necessarily, if you have AtariDOS, MyDOS, or most other kinds of DOS then it is a menu-based DOS, if you use SpartaDOS, DOS/XL, or DOS/XE then it is a CLI. But none of them are compatible with MS-DOS.

>Are PC and Atari dirves/disks compatible?

They are not all compatible, as far as common encoding technique, the XF551 disk drive uses MFM encoding, so it is 'technically' compatible to MS-DOS. But the disk directory structure is not compatible, and MS-DOS wouldn't understand if you threw an Atari disk in there. The 1050 and the 810 use FM encoding, some drives/controllers on the PC side can handle it, but again MS-DOS wouldn't understand it. You need a program that will be able to retrieve the directory structure, files, etc.

>In other words, is DOS for Atari MS-DOS compatible?

No.

>And ultimately, can I copy my boot cassette programs to floppy
>disk? How is this done. Thanks,

Don't know. But here is something helpful you may want to know:

To boot from a cassette, hold START and turn on power, once you hear the beep noise then press play on the cassette and I believe you have to press RETURN on the Atari, not sure about that. <It's been awhile since I used my cassette drive>

To boot from a disk, hold OPTION <this swaps out BASIC ROM> and turn on power, the disk will boot. Otherwise type 'DOS' from BASIC and it will do so.

#==========lremery@fast.net, 6/22/95==========
#
I'll always have a special place in my memories for AR
#City. Someday I guess
#I'll break out my Atari's and show my Son & Daughter (3 & 2 now)
#this stuff. Will
#it be a fascinating history lesson or will it bore them to tears
#in this age of VR
#instead or AR?

I never played the AR series much (I have the Dungeon with a nice map),
but I spent a lot of time playing Infocom's text adventures. When you
are playing them and thinking about what to do, etc., it is easy to picture
what is going on in your mind. But my son, who is 19 now, could never
see my fasination with these things. Looking back, I would have probably
have felt the same way just looking over someone's shoulder. It's like
reading a book: it only is really engrossing when you are doing it and
picturing things in your mind. I find it harder to do if someone else is
doing the reading.

No doubt; Alternate Reality was the best game I played on the 8-bits;
nothing came close to it until I got DungeonMaster for my ST. I second
the call for hints & maps; if anyone has some, scan them and put them at
an archive site! If you can't, fax (or snail-mail) them to me and I will.

Okay two questions about AR.

1. Has anyone got Alternate Reality to work with any of the Atari Emulators that are around ?

2. If so, where would one buy AR now, and how would you get it in a form that the emulator could use. (If the answer to Q. 1 is no then don't answer this one)

thanks in advance,

Last I saw, a while ago (2+ months) both Alt.R. The City and The Dungeon could be picked up for $5-6 each..

Also, Philip Price is around here somewhere still I think..?

Finally, as for emulators running AR, umm.. it'd take a cracked copy... <:^/

What an amazing surge of emotion these few lines evoked within me!
The hours/days/weeks/months that I spent playing AR City during the
Summer Hols. after my GCSE`s!!!
My 130XE + 2x1050`s are also still upon my desk, clothed in dust
covers, waiting for my to return! And I shall!!!
Has anyone got a complete set of maps for the City. I`ve got some
rather scruffy, unfinished ones (on about 12 pieces of A4 graph paper!),
but would really appreciate some "real" ones!
Does anyone remember that really smart Dungeon Character Editor
by someone called WosFilm? It was published in an issue of Page 6 NAU
yearsandyearsandyears ago. (Well....). The question that must be asked
is, has he done one of the same for the City. Aha! Good Question. To be
honest, I don`t really need it - it`d just be nice :) -the only thing
that seems to be able to kill me are the nasty potions! Not TREASURE
FINDING! -how I used to hate getting this, then downing a bottle of
STRONG POISON! aaaaaarrrrrgh!
Did anybody ever find the MAGICAL! FLAMESWORD! ?- I only ever
found a *!?&*!? (aka CURSED!) one.

Thanks very much for that very welcome bout of nostalgia! Does
anyone else feel the same way? Perhaps I should start a new newsgroup -
alt.religion.AR.city ?!?! Hahahaha!

Big Bro`

P.S. What, too, happened to the musical maestro, Gary Gilbertson? The
tune for AR - City is still my fave!

Source record: 90580

William Kendrick (kendrick@zippy.sonoma.edu) wrote:
: Dan, the Eamon DCM doesn't boot properly. I loaded it under MyDOS and
: ran it ("RUN "D:HELLO"") from my RAMdisk and it seemed to work ok for
: quite a while.

: At one point, however, when I got to "1. Go on an adventure", it gave me
: an out of memory error at line 20000-and-something (one where there's
: a DIM V(26) command).

: So, I tried it from TurboBASIC XL and it ran the same (faster of course)
: and (since TBXL also has more free RAM) it DIDN'T give me the out of memory
: (ERROR 2) error, BUT it eventually, around the same place, gave me a
: "TRUNC" error.. <:^(

If the disk doesn't boot properly, then I probably didn't make the DCM
correctly. The game was written using DOS 2.0s. I never used MyDOS, so I
can't say why you were having memory problems. As for TurboBASIC XL, again,
I never used it. I wrote the game on an 800. I just recently acquired a
130XE, so I will obtain a copy of MyDOS and check it out.

In fact, I just tested it out myself on my machine, and was able to adventure
quite nicely. Could be a result of the bad DCM? I will remake the DCM and
re-upload it.

We'll see if that solves the problem.

Big Bro',

I gotta tell you... AR City, the atmosphere, the MUSIC(!!!), watching
the sun rise and set, braving fierce thunderstorms, hearing the distant
trumpets near the Palace, the fighting in the Arena (how many times have
you wished you could just climb to the top of those walls just to take a
peek at what was going on inside?), even dragging my poisoned ass to one
the Healers only to find that he was out. I could go on and on, as I'm sure

you also could. There was something incredibly entrancing about City that just wasn't there in Dungeon (though Dungeon was GREAT fun too).

Yeah, I wonder about Phil Price and especially Gary Gilbertson. I wonder if Robert Prince (my current favorite composer for computer games: Wolf3D, Doom, etc.) was influenced by him in any way?

I've still got all of my Atari stuff boxed away: an 800 and two 130XE's with plenty of spare parts, two Indus drives, two 1050's (one with Super ArchiverII and Bit Writer, the other Happy), loads of other stuff. My 800 has the Impossible! installed. That was about the best legal way to back up protected s/w until SA-II w/BitW came out.

I'll always have a special place in my memories for AR City. Someday I guess I'll break out my Atari's and show my Son & Daughter (3 & 2 now) this stuff. Will it be a fascinating history lesson or will it bore them to tears in this age of VR instead or AR?

Take care,
Larry

: If you could tell me how you did the sampling that would be fine
: or just post the source code). Did you use a timer interupt?

Tim -

Believe it or not, as far as I can remember the digitizing ciruit helped
improve the quality of the sample. I dug through the source code and was
able to find the digitizing routine. My comments and labels were very
sparse as to enable MAC/65 to assemble everything in RAM. These days, I cross
assemble everything using a PC, so I don't have that problem anymore.

Here's the code... I don't remember how or why it works (I was a senior
in high school when I wrote ASP...) I didn't use a timer interrupt. I
just disabled pretty much everything except the NMI and plopped the
machine in a polling loop:

```
Record LDA #0
STA $D400 ; Disable DMA
STA $D40E ; ...and VBIs

Loop STA $D40A ; Wait for WSYNC
STA $D40A

LDX RecordRate
BEQ NoDelay

JSR Delay ; A delay routine...

NoDelay LDA $D202 ; Read Port 0
LDX #$13
STX $D20F ; No fast scan

LDX #$17
STX $D40A ; Wait for WSYNC
```

```
STX $D20F ; Fast pot scan

STX $D20B ; Start scanning

LDX NibbleSelect ; Upper of lower 4-bits???
BNE LoNib

HiNib AND #$F0 ; Save the nibble (we're going to write
STA TempVal ; it to RAM in LoNib)

ROR A
ROR A
ROR A
ROR A

AND #$0F
ORA #$10 ; Use 4-bit D/A
STA $D201 ; and echo sound to speaker

INC NibbleSelect
BRA Loop

LoNib ROR A
ROR A
ROR A
ROR A

AND #$0F
ORA #$10 ; Use 4-bit D/A
STA $D201 ; and echo sound to speaker
AND #$0F

ORA TempVal ; Or in upper nibble
DEC NibbleSelect
STA (CurMemPos),Y

;
; Check to see if end of RAM has been reached...
;

; If not...

BRA Loop
```

That's about it. It might not be the best 6502 code, but it works (or at least it did --- I just hope I didn't make a typo)...

WHAT modems act this way? Certainly not any manufactured in this
decade. Every modem I've ever used has treated backspace as a
backspace, not some Cancel code.

> the computer, but not the modem). There usually is no need to
> reboot. You merely enter a CONTROL-M/CONTROL-J and then type an

"CONTROL-M"??? You mean, the "Return" key? Sheesh, talk about
needlessly confusing things!

> Having your modem stuck in a typo is a very common occurrence. I
> do it at least twice a day. It is not a big deal, and there is
> certainly no need for you to reboot your machine (unless the "R:"
> handler has been messed up).

The ONLY circumstance under which a Hayes-compatible modem will "lock
up" is if you type "AT" and then change baud rates. The "AT"
sequence is used by the modem to determine what baud rate its host is
talking at, and if you switch after that, it will still be listening
at the previous baud rate. The only way out is to change back to the
original baud rate (or cycle power to the modem, which is kind of
overkill).

A PC with a serial port (even on old 8088!)
The SIO2PC software for the PC
available via ftp from the UMich archive
The SIO2PC cable
instructions via ftp from the UMich archive

That's it. No software for the Atari--the cable translates SIO calls
to RS232 signals, and the PC emulates the disk drive. The Atari can't
tell the difference, except in the speed (it's a bit faster).

If you have a PC, you should definitely get SIO2PC. What better use
for a PC than as a fileserver for you Atari?

Quoting ehalliwe@emh.kunsan.af.mi

e >At the risk of suggesting the obvious, have you tried toggling
e >"Backspace Char" from the terminal menu?
e >(and whoever said to hit ^H instead of backspace... ^H *IS*
e >backspace!)

Another case of people who will not read the Doc's... I've been using
FT almost every day, switching between BobTerm, ATZ, and PabQWK and I7ve
yet to run into any of the talked about problems. (true, I do use a BB
so I've not had to worry about R: problems...)

Mike

EH> backspace, not some Cancel code.

Well, my modem wasn't manufactured in this decade. Actually, the
input abort might be a function of the term program I use, KERMIT-65.
KERMIT-65 might have the BACKSPACE key set to DELETE or abort input.
I am talking about BACKSPACE and not about CONTROL-H.

WS> the computer, but not the modem). There usually is no need to
WS> reboot. You merely enter a CONTROL-M/CONTROL-J and then type an
WS> "AT" (enter attention mode) query. Your response would be either
>
EH> "CONTROL-M"??? You mean, the "Return" key? Sheesh, talk about
EH> needlessly confusing things!

I mean the "Return" key ? HUH ? No... I mean International Standard
646 for Binary Coding of a Character Set, European Computer Manufacturers
Association Standard Character Set 6, ANSI Character Set X3.4-1977, CCITT
Character Set V.3, STICKS 0,1, of the eleven DEVICE CONTROL characters,
specifically ASCII character 013 for device control designated "CARRIAGE
RETURN" and ASCII character 010 for device control designated "LINE FEED"
(when using decimal numbering). I do not mean "Return" key ATASCII 155
(decimal) which must be translated by an interface. I mean literally
entering the device controls and sending them directly to the modem. The
safest assumption to make when encountering modem problems is to send the
direct device control characters and not assume that translation will be
performed (unless the modem is designed to interpret native ATASCII). By
sending the device controls you usually guarantee a reset of the input
buffer (ditto for UNIX terminal "raw" mode).

WS> Having your modem stuck in a typo is a very common occurrence. I
^^^^^^^^^^^^^^^

>
EH> The ONLY circumstance under which a Hayes-compatible modem will "lock
EH> up" is if you type "AT" and then change baud rates. The "AT"

EH> sequence is used by the modem to determine what baud rate its host is
EH> talking at, and if you switch after that, it will still be listening
EH> at the previous baud rate. The only way out is to change back to the
EH> original baud rate (or cycle power to the modem, which is kind of
EH> overkill).

Well, thank you for redefining "stuck in a typo" as a hardware "lock
up", however, if I had --meant-- a hardware lockup, then I would have
--said-- a hardware lockup! Sheesh, talk about needlessly confusing things!
...but seriously, I use an actual Hayes "Hayes Stack" SMARTMODEM 1200,
and when I butterfingers a dial command from the keyboard, I abort the
input. Let me think... How do I do it ?... Hmm... I think I dial the
partial string and immediately type the [-SPACEBAR-]. Then I type
CONTROL-M and CONTROL-J. I seem to remember being able to abort the input
string with a DELETE character, but perhaps that is when using my NOVATION
300. Perhaps the Hayes "compatibles" behave differently ? I have noticed
that some of them actually drop DTR when they receive three guard
characters, instead of diverting to the modem command input channel.
Hmm... perhaps it is time to again look in the Hayes manual and see if
there is a documented method for aborting a modem input string besides
CONTROL-H-ing over the input line. (It's been a while since I read the
whole thing cover-to-cover.)

Hey! GIF/JPG to CV conversion would be EASY!

Just first convert the image into a PPM and then convert the PPM's
values and size into a set of CV files! (besides, PPM is ALREADY
uncompressed R/G/B data!!)

Good idea! I think I'll try it!

YES! Since 3 out of the four sides of AR:City are copiable but side 1/disk 1 is not, I'd REALLY like to see a patched version of side 1/disk 1 available somewhere.. the disks are obviously old (not like they were still being MADE up until now!) and my 1050's are kinda on the fritz sometimes, so... PLEASE! Put a patch up!

DON'T put the whole THING up though, since that's plain piracy all the way.. If you HAVE the game, you can make copies of the other sides and then just get the patch to "finish the collection"

Boy, am I rambling or WHAT!? :) Anyway, yes, do it! I DEMAND! (heh)

I believe Fortier went to Disney and worked on "Stunt Island".

Chris Crawford did "Balance of Power" for Mindscape. And
some other war games. Founded the Computer Gaming Developers
Conference. (he's pictured in a recent PC games magazine)
He wrote some BASIC tutorial book a couple years ago.

(Copy boot tape to disk.?)
Uhmm. You can find a cracked version of whatever boot tape you're
talking about sometimes, if you look hard enough in the right places.
Almost all commercial boot tapes are copy protected. Sometimes you can
dump the tape to disk, then hack the code to make it work on disk.
Most commercial boot tapes had disk versions, see sentence #1 (after
the Uhmm.). You can load the tape, maybe be able to break into the
program with Omnimon or the BB monitor and dump memory and hack the
thing into a load file. I think that's about it.

Yeah Kit, you're probably right about that (sigh). I guess this is just something that'll just die with us. If the kids can't be coaxed into discovery for themselves and kindle their OWN interest in something, I guess they never really truly internalize it.

Despondently,
Larry

Yeah, I remember. But the WORST part was when you died, you had to reload the ENTIRE PROGRAM. In my anxiousness, it felt like it took HOURS to get back in. Always kept a couple of copies of the disk you saved games to. That was ONE thing that the Dungeon had over the City.

686. New Eamon uploaded

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-24 00:00:00 UTC
From: dann@elvira
Message-ID: <DAnznq.DB@nymt.reuter.com>
Source record: 90519

Hello again everyone.

I just uploaded a new EAMON.ARC to ftp.xmission.com. It's in the
/pub/users/j/jeking/uploads directory right now. This ARC is a .DCM
file made with Disk Communicator 3.2, since the first DCM didn't seem to
boot properly.

A word of warning - don't try to run the game under MyDOS. There apparently
is a memory shortage problem. The only DOS I have ever run it under is
Atari DOS 2.x. (Sorry Bill!) However, the disk boots with DOS 2.0s, so
there shouldn't be any problem anyway.

Have fun, and if there are any problems, mail me or post.

687. REALITY PROBLEM

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-24 00:00:00 UTC
From: rzabaga@aol.com
Message-ID: <3sg9dq$f9a@newsbf02.news.aol.com>
Source record: 90520

This is my puzzling problem, can anyone solve it????

I run ALTERNATE REALITY on my 800xl, but it runs off of an IBM using the SIO2PC cable. In SIO2PC, I can define 4 "disk drives" for all four AR disk-sides. There is disk 1 side a,b. There is disk 2 side a, b. The problem enters when I need a character disk to store/save a game. SIO2PC will let you load up 4 images, so I don't know how to play anything but a temporary game....
(and as we know, you MAY have to save your character!!!!!!)

Has anyone tried this?
Has anyone tried this and lived?
Has anyone tried this, gave up, tried it again for kicks, then finally gave up?

Let me know.

: form that the emulator could use. (If the answer to Q. 1 is no then
: don't answer this one)

You an still buy AR for $5 or so (last I heard) from B&C or one of the other atari houses. If you want to run it with sio2pc you will need to make ATR images of your disks, and them patch the AR disk 1 so that it will run without copy protection.

Since you CAN buy AR for an incredibly reasonable price I have decided not to upload a copy to xmission. But if there is enough demand (speak up! :) ill release a patch to let you unprotect a copy of the original disk.

"SO, is it worth fixing to have a simple entertainment option
for my kid, or should I just trash bin it?"

Don't trash the XEGS. I am certain it would be worth at least the cost
of shipping (and no doubt, the additional $5 it cost you) to someone
else for spare parts.

I would make that offer, but I am not certain how easy a time you would
have trying to cash a check drawn on a US bank there in Canada.

Sorry Earl, but I've never seen such ignorant drivel from someone who *almost*
sounds like he knows what he's talking about. You obviously have limited
experience with modems. Most terminal programs use an emulation of terminal
type that can change the normal function of the keys on a keyboard. The
purpose of using ^H or ^M,^J, etc., is to insure the proper characters are
sent to the modem independent of keyboard or terminal type. This is
especially evident with an Atari because of atascii. Before you flame
someone, make sure you check to make sure you're not holding an open gas can!

Try talking to Computer Software Services, 716-429-5639.
They don't have Chipmunk but Bob Puff used to have a simular one
called Black Patch, I beleive.

I've got maps of the 1st levels for both AR The City & The Dungeon. Matter of fact, in the sequence of the rights going from Price to DataSoft to Interplay or whoever, I called them up & asked if I could make copies for other people. They said they had been sold out of hint books so go ahead. Funny thing is when I sent the RLE files of The City map to some people they came back with, "What the hell are RLE files, I can't view them on my computer!" I'd be willing to make one lousy copy of each & mail them if you want to scan them. Problem is I only have a 4" wide scanner & these things are 18"-23" accross.

Well, not necessarily with AR, but sometimes I run SIO2PC with a ATR8000 hooked up to 4 real floppies or a 1050 & all I do is have SIO2PC configured as drives 5-8 or 2-5 respectively. I have a run Ultima III a lot off of SIO2PC by either running a 1050 to get the copy protection taken care of, then shut off the 1050 & load up data disk on SIO2PC. I also cracked a copy of UIII so I can load the two sides into SIO2PC images, after I boot the game I just hit 'X for exchange ramdisks when the program prompts me to insert disk 2. I think the utimate<sic> set-up will be a VLB Pentium running the emulator with an 8088 running SIO2PC feeding it programs<g>. My son finnally got his Atari/SIO2PC cable to run under OS/2, but it took him 2 or 3 days of setting up the serial ports to handle it properly. This is on a 33 MHz 486. Funny thing is I've run SIO2PC on an AT&T 6300 I picked up for $40 in a Desqview window. I can even play a game of Rogue on the 6300 while SIO2PC runs in the background. As far as I can tell, no one has ever gotten it to work under Windows. Sorry if I couldn't resist taking a swipe at what is considered "progress" in the MS DOS world. It's just seems funny when a 8 mHz 8086 running a copy of Deskview I bought for $5 is easier to use/works at all compare to OS/2 or Windows.

Source record: 90529

I said BobTerm corrupts files and nobody blinked an eye. If BobTerm corrupts files then it could be the source of some of the upload/download problems around this internet. The reason I said it was because I was trying to transfer files over null modem using BobTerm and Procomm plus. Now, I know X-modem and X-modem CRC will put up to 128 bytes on the end of a file, but if I remember correctly, I was using y-modem batch and was getting incorrect crc16 checksums. I think mostly because y-modem batch was also adding bytes to the end of the file. Anyway, it took AtarZmodem to get correct file transfers. I suspect DCM files don't take kindly to extra bytes at the end. Somebody oughta check this out.

711. 600xl hardware interface

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-26 00:00:00 UTC
From: WILSON D <W167@UNB.CA>
Message-ID: <26JUN95.23486634.0043@UNBVM1.CSD.UNB.CA>
Source record: 90408

i am building an interface to the 600xl parallel bus
which will allow for the use of serial and parallel
chips (pia and acia) .These chips will allow for easy
interfacing to other projects
The main problem is the fact i don't have a memory map
for this computer (bought computer at yard sale)
the computer came with a 64k ram cartridge,but it
doesn't appear to work (poked value above 16k,but peek
returns unchanged value).part of the decoding involved
the pins external select, and phase 2, and external
decoder ouput.

Not knowing what to expect from the two external lines
i decided to decode the address lines for a small range
of unused memory (approx 6000 or 7000hex can't remember at moment)
poking and peeking this location suggests rom or unused
(returns 255)(as i am writing this, i've decided to perform
some tests to see if surrounding locations contain 255 also,
if so, then this would suggest unused area, which is what
i want)
if above does't pan out, i will send data to devices thru
data bus, and retrieve through joystick ports with the help
of latches (each port can read 4bits)

if anybody can supply basic memory map of computer and/or safe
addresses for projects of this nature ,please email to me

thank you dean wilson w167@unb.ca

BobTerm doesn't corrupt files. I've used it many time to do null transfers
between my Atari and PC, and nothing has come out wrong at either end.
Either your copy of BobTerm is corrupt, or Procomm is doing something
wrong. I use QDHost for Telix, and it works perfectly.. I would suggest
using it, too, since it's meant for regular dial-up and null connections.

BTW: could you send a UUencoded copy of AtarZmodem to
ba930@freenet.carleton.ca? I'd like to try it out.. I didn't think the
8-bit could handle the data streaming of Zmodem.

From: rldetlefsen@delphi.com
Message-ID: <pu-e2l7.rldetlefsen@delphi.com>
Source record: 90414

JUNE 1995:this is a effort to list all known active Atari users Groups and BBSes. The last list was around Oct 1993, and includes info mostly from Atari User and Atari Classics magazines. Is assumed to be out of date. Please fill out and return via email or regular mail. Also, pass this around as we need as much information as possible. Save a copy for future changes.
SOAPBOX:The Atari market and active User base is shrinking. Many people are isolated, many have been lost. The available users must support the User Groups, BBSes, Vendors, Magazines, and Online Services to the fullest extent possible. Compuserve, Genie, and Delphi all have weekly conferences at the lowest prices ever. We must let people know support is still available. Only in doing this will Atari support and the enduser survive.

The results of this survey will be posted to online services as a list and possibly as a file for importing into databases. Updates will be posted as needed. Please include 8 bit, ST/TT/Falcon, Games systems, Lynx, Jaguar, Portfolio, etc.

Message-ID: <d6c_9506281345@tor250.org>
Source record: 90415

```
L > I am looking for any information regarding the Atari 8 bit cartridges.
L > Is
L > thereany info regarding the size of the eproms, size of the program in
L > the
L > cart, etc.Also, is there info regarding looking at the code to a
L > particular
L > program.

Well to actually look at the code on a cartridge you'd need a way to
stop the cartridge from taking over the system. There is a location that
can change the boot status of the cartridge. The address in the forth byte
in the cartridge header, and depending on which cartridge(left or right)
you plan on accessing, the address will be different.

I think the original max size for a cartridge was 64K, but companies like
OSS/ICD came up with a way to create what's known as a Super Cartridge. It's
supposed to be able to handle 128K through bank switching.

Later...

Yep, I still exist. No, I never got around to uploading my old source to AR. (Who knows if the floppies still work after all these years)(I am definatly a procrastinator). Yes, I mainly do work on silicon graphics workstations used for testing planes at my present job (Same job since I left the game business). Yes , at home I have an IBM PC(and my old ataris, a c64, my amiga is gone though). Yes I am on a standards committee(But it is the ansi C++ standards committee).

On the otherhand, I do want to thank everyone who has enjoyed my past work. That is of immense value to me personally. Plus, it may contribute to me reentering the game business. The business has matured a bit since I was in it(Hey :), Tail of Beta Lyrae was written on a 32k ram atari 400 with a cassette drive, and I had no running water and slept on a green bed with mold(Also I had no, and I mean I had no money then), by the time I left the
business I did have a roof over my head(a room in someone else's house), no car(I soon bought a ford escort from a cousin), and no savings. I left because I did not want to have to forever fight for a fair share of the value of my craft, I wanted to have a degree of financial security, so I left to
join a Fortune 100 company, who I have worked for ever since(I now own a home, a car,[still no savings though:). But even though I get to design complex systems at my current job, they rarely need all that I can give. Therefore , the current work is less invigorating than designing and implementing games(Where the need for creativity and originality is never-ending[If you are with the right team]). I have had people at my current work tell me that I should follow my art, and not just settle for corporate comfort. I have had strangers at the local Walmart, remember who I am(This ten years since I left the business), and say that they just do not make them like that anymore, that there was something intangible, but extremely attractive in my work; and finally, of course, there are the people in this newsgroup, who still at times, talk about AR (and even Beta Lyrae;). The fact that my work touched people is confirmed by these
reactions. This in turns makes me want to give once more all that I can give that will bring some joy to others.

I am glad I have been able to serve my country by being a part of a team which designed telemetry systems. You might say that when I left the game industry I beat my
plowshare into a weapon, and perhaps it is now time to beat my weapon back into a plowshare. I have tried to write games on the side(like I say it's in my blood , I been writing games since I was 7[My sister was my playtester:)], but when I try to write games on the side, I find that I get to distracted at work, and work distracts me when I am at home. In

otherwords I can't write games part time. So the only way it will happen is full-time.

I am currently in the final stages of being hired as a lead programmer at a game company. If their offer is attractive, then I may finally be back in the business, I will then contribute to degree permitted by my position.

Oh, it looks like this summer I will finally get my BSCS, that too has been a long time coming, but it's moment is near. Also, Gary Gilbertson still lives in Hawaii, and we keep in touch[I used to have midi copies of all the ar songs until my latest hard disk crash, will have to wait till Gary sends me replacements).

Finally, I once more wish to say thanks to everyone who has found some happiness through my works, it's a two way street, your happiness, brings me happiness.

Thanks,
Philip Price

722. Help with a RANA 1000 and SDX

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-26 00:00:00 UTC
From: mbates@netcom.com
Message-ID: <mbatesDArrvB.72A@netcom.com>
Source record: 90534

I have a Rana 1000 drive and SpartaDOS X. Here is my setup:
Atari 800XL w/ 128k
drive 1: XF551
drive 2: Indus GT
drive 3: Rana 1000
drive 4: 1050

Now, the Rana reads and writes just fine in all densities but it WILL NOT format. Not in SDx, not in DOS 2.5 not nuthin'! Can anyone help?

-Marlin

723. FOR SALE/TRADE: 800XLs, 1050s & 800

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-26 00:00:00 UTC
From: mbates@netcom.com
Message-ID: <mbatesDArs0n.7AM@netcom.com>
Source record: 90535

I have three 800XLs
1 128k RAM (Newell Upgrade) it has no RF shield but seems to work fine
2 Stock 800XLs

1 also have 3 STOCK 1050s

EVERYTHING has power supplies and works fine. I am lookinf to either
trade them for other 8-bit stuff, 2600 carts or even Lynx stuff!

I also have about 30 8-bit carts for trade as well as books and some
disks software! If you are interested send e-mail with an offer!

ALL offers will be considered!
-Marlin

724. Any info about Sweet 16

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-26 00:00:00 UTC
From: CONRADUS@PLEARN.EDU.PL
Message-ID: <199506260632.BAA03110@mail.cs.utexas.edu>
Source record: 90536

Hi.

I am still waiting for an info about Sweet16. For those, who didn't see
my last mail (it was some time ago), I repeat my questions:

1. Data bus wide (8 or 16 bit)?
2. Main clock (the same, as for 6502, or higher)?
3. *Real* speed improvement (if any)?
4. Compatibility?

A.h.w.b.g.a. (= any help would be greatly appreciated)

Regards

Konrad

727. Atari virtual disk editor - Macintosh

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-26 00:00:00 UTC
From: richczeta@aol.com
Message-ID: <3sma1c$qt7@newsbf02.news.aol.com>
Source record: 90539

AtariVD Editor 1.1 is an Atari 8-bit virtual disk editor for the Macintosh. It can work with XFD, ATR, & ATD (a file with a Macintosh format header) file types.

Disk formats currently supported are Atari DOS 2.x and MyDOS 4.5. A future version will be able to create and extract DCM files as well.

Please read the included documentation before using AtariVD Editor. I've tested the program and it seems to be fairly stable, but I may have missed something!

AtariVD Editor 1.1 is freeware.

Please feel free to download the program and give it a try. Comments, bug reports, etc, are welcome. I can use all the help I can get!

AtariVD Editor has been posted in comp.binaries.mac as a binhexed .sit archive in 4 segments.

I've had a hell of a time getting this uploaded through AOL; unfortunately my only internet link right now.

Richard A. Carvel
Email: richczeta@aol.com

731. Newell 1 Meg for 130XE

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-26 00:00:00 UTC
From: Michael Current <mcurrent@carleton.edu>
Message-ID: <3smem9$rmq@chuangtsu.acns.carleton.edu>
Source record: 90543

I'm looking again for people who have successfully done the 1 Meg RAM upgrade for the 130XE by Newell (now available through Fine Tooned Engineering). My upgrade has never worked properly, and the problem has foiled several people so far.

First of all, there are plain errors in the installation instructions. I believe we understand them and have corrected them. The problem consists of a limited set of memory banks that misread sometimes. Swapping RAM chips does not affect the symptoms, including the banks affected, so I don't believe bad RAM is the problem. There are no error messages involved, and every bank reads correctly at least some of the time, so I don't believe there is an additional simple wiring problem.

Can anyone offer advice? This one has been a problem for about 10 months now.

732. Atari 800, 810, and software -- $25 plus shipping

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-26 00:00:00 UTC
From: dgb@owlnet.rice.edu
Message-ID: <3smlaq$egf@larry.rice.edu>
Source record: 90544

I posted this before but the price was probably too high.
Now I'll sell the whole package below for $25 plus shipping
which comes to $50 total:

Atari 800 console (48k) with power supply, Atari 810 disk drive (the very
first version and in great condition) with power supply, Atari 410 cassette
recorder, BASIC cartridge, RF switchbox, and joystick. Comes with manuals
and Pole Position game disk.

Box of Atari Software: All tested, all work, all include manuals
and most boxes. The list: Chem Lab, Sons of Liberty (SSI),
Atariwriter Plus, Printshop and Printshop Companion, Enchanter (Infocom),
Clear for Action (Avalon Hill), Combat Chess (Avalon Hill), Battle of
Antietam (Avalon Hill). Also, I will include original manuals
for SynCalc, SynTrend, SynFile+, and VisiCalc (I lost the disks!).

I'll ship UPS, within the U.S. only, no C.O.D. E-mail if interested.

I wrote a utility to fix files xfered with xmodem a long time ago. The name of the program is STRIP3.BAS. Although it's in basic, it uses fast IO, so it is fast and easy to use. I know it's at UMich, I think under the CIS directory.

From: ehalliwe@emh.kunsan.af.mil
Message-ID: <9506271108.AA18552@emh.kunsan.af.mil>
Source record: 90548

ATTN, Flick fans!

I have just uploaded version 0.51 of FlickerTerm to James King's xmission.com
FTP site. I would have spread it around more but I'm moving in two days and
kind of pressed for time.

Still no capture or protocols, but Flick now has:
Onscreen ROT-13 decode
Print screen with settable margins
A file menu
EOL click
User-definable character attribute maps
Assign any console+key combo to any joystick direction or CX85 key
Macros, macros, macro! 10 at once, with 70 characters per macro,
plus rudimentary commands for pausing and commenting
Arrow key mode... one-key cursor movement!
Corrected handling of Application/Cursor/Numeric key modes
Improved incoming CR/LF reinterpretation
Ability to set data bits and parity
Plus the usual speed optimization tweeks...

Enjoy!

1) I dunno (data bus)
2) Still at 1.79Mhz (for now I guess)
3) Speed improvement would come with faster block moves and the tons of
new opcodes and addressing modes.. ie, still get 1.79Mhz, but I guess
now you get some instructions which replace other 6502 SETs of instruct-
ions..???
4) 100% compatible (so I've heard) with 6502. You still also get a lot of
the 65816 nicities IN emulated mode: 24bit linear memory (16MBs if you
have it.. brings up the question.. with what FTe addon do you GET it??)
mode opcodes, more addressing modes, etc. I think all you lose in 6502
emulation mode is 16bit registers...

Ack! I just jumped in on this conference, missed your original message,
sounds alot like a multi-player game on the internet called NetTrek, it
has a sever running on a Unix machine that all the players connect to via
Telnet, according to data that is almost a year old, there are versions of
the client for Xwindows, most major workstations (i.e. RS/6000,
SparcStation, etc...) for Amigas, and for the Mac...

And: AFAIK, most computation for Air Warrior is done on the individual
client, all Genie does is relay each players position to other players in
the game...

I heard years ago a rumour that Datasoft had rushed the AR - The City and so many of the game elements that would made The Dungeon a better game (IMO) were missing. I thought the City showed a lot of promise but was missing just that little bit. It was very surprising to find that you couldn't join any guilds, visit the Casino, talk to anyone or find any treasure in the huge number of secret rooms.

Can anyone confirm this? Perhaps even Philip Price himself after his recent posting to this group (Beta Lyrae is an excellent game, I must admit).

747. Atari 8-bit computer stuff -- FOR SALE/TRADE

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-27 00:00:00 UTC
From: dw901@cleveland.Freenet.Edu
Message-ID: <3son6f$a91@usenet.INS.CWRU.Edu>
Source record: 90419

updated 06/27/95

I have the following Atari 8-bit computer equipment for sale or trade.

Everything is sold as is. Unless specified, all items have been tested and are in perfect working order.

Buyer has ten (10) days to send payment, and pays all shipping costs, which will be sent via U.S. Snail. The shipping cost depends on both the weight of the package and the distance that it is traveling. The buyer has the choice of either first class or parcel post (slower, but cheaper).

Payment must be made in U.S. funds, by either check or money order, drawn from a U.S. bank branch. Canadian buyers must send a Canadian Postal Money Order, payable in U.S. funds. This is the only way I have found to deal with my friends to the north (my bank is very picky, but the U.S. Post Office will cash a Canadian Postal M.O.)

*****

LOT #1

ATARI 400 COMPUTER with RCA cable, and 410 Data Recorder.

This is a complete system, except for RF switchbox and power supply.

$15.00

*****

LOT #2

ATARI 600XL COMPUTER with original power supply, and RCA cable.

This is a complete system, except for RF switchbox.

$29.00

*****

LOT #3

ATARI 800XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second non-working ATARI 800XL for parts, FREE.

This is a complete system, except for RF switchbox.

$49.00

*****

LOT #4

ATARI 65XE COMPUTER with original power supply, and RCA cable

This is a complete system, except for RF switchbox.

$39.00

*****

LOT #5

ATARI 130XE COMPUTER with original power supply, and RCA cable.

This is a complete system, except for RF switchbox.

MINIMUM OPENING BID OF $64.00

*****

LOT #6

ATARI 1050 (127K) DISK DRIVE, with original power supply, and one (1) Molex connector cable.

$40.00

*****

LOT #7

ATARI 1050 (127K) DISK DRIVE, with one (1) Molex connector cable.

This disk drive doesn't include the power supply.

$34.00

*****

I am interested in accepting 8-bit computer and/or pre-Nintendo video game systems and/or cartridges in trade towards any of these items. Systems I am interested in include, but are not limited to, the following list:

ATARI 2600
ATARI 5200
ATARI 7800
ATARI 8-BIT COMPUTERS
BALLY ASTROCADE
COLECOVISION
COLECO ADAM COMPUTER
COMMODORE 64 COMPUTER
COMMODORE VIC-20 COMPUTER
FAIRCHILD CHANNEL F
INTELLIVISION
MICROVISION
ODYSSEY2

SEGA MASTER SYSTEM
TEXAS INSTRUMENTS T.I. 99/4A COMPUTER
TOMY TUTOR
TRS-80 COLOR COMPUTER
VECTREX

Please send a list of what you have, and I'll let you know what I can offer. Please be specific, and indicate whether or not items (cartridges and/or systems) include the box and/or instruction manual. Please also mention how many, and what kind, of controllers are included.

Request system reservations at: dw901@cleveland.freenet.edu

Michael J. Novak Jr.

William Kendrick <kendrick@zippy.sonoma.edu> writes:

>I'm sure nobody knows yet, but just in case...
>
> Do the nir-PAL upgrade and Sweet16 CPU upgrade work together alright?

The Sweet 16 has been tested in a "real" PAL computer here in-house,
and works just fine. Nir's upgrade is simply a modified operating system
in conjunction with a PAL Antic.

The idea was so utterly "simple", that I'm suprised that nobody
had managed to do it sooner. Hats off to Nir Dary for his persistence
in pulling the loose ends together, and sharing this type of cool hack
with the Atari Community. There is a lots of new software to play with
on this pseudo-universal Atari.

I'll be able to keep the MARS open-ended for PAL support now,
and make sure the MIO II also gets tested for compatibility. I don't
suspect any problems, but stranger things have happened...

Mike

749. Re: Sweet16?

Source record: 90421

The Sweet 16 is more of a "board" than it is a "card". It comes with a 65816 processor, and will support linear memory via the upcoming release of the MARS 8 board.

The 65802's have been discontinued for a while now, and didn't support memory past the 64K boundry. It was primarily intended as a plug in replacement for the Apple II's, and anything else that might have used a stock 6502 processor.

I just wanted to clarify that the Sweet 16 board will work just fine
with banked-memory upgrades. The 65816 microprocessor is capable of supporting
a virtual memory addressing scheme, but until the OS is finished to support
native mode, I wouldn't worry about it too much at present.

The MARS 8 will support '816 memory with it's SIMM socket, and there should
be some homebrew upgrades making an appearance in the future as well...

Hope this helps. Mike

>2. Main clock (the same, as for 6502, or higher)?
>3. *Real* speed improvement (if any)?
>4. Compatibility?

Konrad,

The 65816 uses an 8 bit data bus. The clock speed is the same. (for
now... <grin>) The speed improvements come primarily from using the new
'816 commands (such as block move), and the real advantages now...
Are that a) the processor "is" capable of running faster.
b) the new opcodes are very useful, and programs
are capable of being "smaller".
c) it will support up to 16mb of memory via a 256 banks
of 64K blocks scheme.
d) Most of the "new" code being written here in-house is
geared towards exclusively supporting the '816 because
it is so cool.

As so far as compatibility... It will choke and puke with software
that uses the illegal undocumented opcodes in the 6502, but I have yet to
run across any of these to date. (but I'm sure they are out there somewhere!)

Otherwise, it runs like a champ. The real problem with the '816
was getting the timing under control to work with hard drives on the PBI
such as the Black Box and MIO. I've used the Sweet 16 with XL's XE's and
both MIO's and Black Boxes here, but there is always a possibility of a
"certain" XE in combination with a "certain" Black Box, may not work very
well. The only way to find out is to just try it...

>Hi, I am about to buy a sweet16 card, does anyone have infos about the way
it
>works, what is best with it cpu 65816 or cpu 65802?
>
Although far from a 65816 expert, I have the manuals for the sweet 16 board
after a recent visit to Mike in Arizona. In 6502 Emulation Mode almost all
the good stuff (24 bit addressing, additional Opcodes for fast memory
moves, etc.) are available, what you can't have are the 16 bit registers.
To get at them you must go to Native 65816 mode and right now there is a
problemn with handeling the interrupts, so to do any work in Native mode you
have to disable all the interrupts. This is being worked on as I write, but
even in Emulation mode you get some neat things. There is an example in the
docs of how to use the new memory move Opcodes with Textpro 4.55 to greatly
increase the speed of the moves, and this can be done to any software that
uses these routines a lot for an increase in performance. @4 bit addressing
gives you access to large amounts of memory in a linear fashion (as opposed
to bank switching) but of course present bank switched memory upgrades
won't work with this! Memory mods are being worked on. No, it does not run
at a faster clock speed and it still has an 8 bit data buss. I did see it
running on an 800XL, compatability should be 100%, installation is a snap.
Pull out the 6502, plug in the 65816 board. Bill Kendrick has my manuals now
and can probably answer questions more intellegently than I, so yell for
Bill!

```
(C. Brown says BobTerm doesn't corrupt files.)
I've used BobTerm for years, also. I never noticed 'corruption' until
I tried to do a null modem of a DCM that kept not working. I may not
turn you into a believer, and I certainly haven't thoroughly checked it
out myself, but I know I got some kind of errors using y-batch and had
to use AtarZmodem to get a correct DCM file transfer. I really don't
expect you to believe my rather unsophisticated 'test' of BobTerm, but
maybe someone will, no, make that, if it really counts, check your
transfers, using null-modem, each time you do a transfer, it could be
that BobTerm is adding bytes at the end or something. A good way to
check a null modem transfer is with crc16v20.arc. Maybe some day I'll
look more carefully at exactly what happens with y-batch and Procomm
Plus and BobTerm. I've never had any problems with Procomm Plus,
actually I use external dsz y-batch, which is the REAL y-modem.

I always used Copy All to back up my character disks, until I got AR Revive by Tim Patrick. He also did a full editor for AR Dungeon, but I don't know if I still have his version or the other by "The Fox<???>". I'll mail you my originals since it will probably work out better scanning those, just put a stamp on 'em & send them back when you're done.
IMO: MyDOS has a bug in it for the DUP DISK routines. Instead of giving it a disk to dup, give it a range of sectors, like 1-720. OR you can just let it goof up the last 200 or so sectors, then give it the range of something like 500-720 to pick up the part it missed.

I finally exumed a bunch of my old 8bit stuff and as an extra bonus I found a box of disks that belonged to a friend. In the box is a really interesting game called "Return of Heracles". I am amazed at the detail and play value this game has after so many years! Does anyone know anything about this game? All I have is the disk, no docs, no instructions, no nuthin'! I'd be willing to buy a more complete version if anyone has it.

Thanks!

Chris; BobTerm & just about every other implementation of Xmodem on an Atari probably do corrupt files. At least when doing Null Modem tranfers between Atari's & clones. I haven't bothered to check out BBS software to see if the files are the right size, but at least for computer to computer transfers the Atari Xmodem is non standard enough to give some software fits. Problem seems to come from the padding of the last 128 byte Xmodem block. I hope someone will correct me here if I've got it wrong, but what seems to be the problem is: Let's say you want to transfer a 131 byte file from your Atari to a clone. The first 128 bytes is sent normally & the clone grabs it, the Atari sends the next 3 bytes as 3 bytes of data + 125 bytes of the character ASCII 3 followed by checksum. This ain't normal, everybody else uses a different padding character, Atari just uses the number of valid data bytes to pad the 128 byte block. It's enough to confuse software for other computers & more then a few of us have seen these bytes added permanently to files. Once there added, they're there for good. The problem isn't specific to BobTerm, it can happen with all Atari Xmodem transfers.

That is correct! In today's USA Today (Tuesday, June 27, 1995) there was an article on orphaned computers titled, "Loyal Users Cling to Comfortable Old Computers" [page 4D, "Life" section, USA Today 6/27/95].

The Atari 8 bit was mentioned along with other older computers. Among those quoted were Len Stys, Michael Current, Rob Funk, and Michael Hohman of Fine Tuned Engineering.

Check it out...

When I was 15 or so, AR and my Atari introduced me to a new world of game playing, and I haven't been the same since (huhuh). AR was and alwas will be my favorite game. (Ok, DOOM runs a close second.) I enjoy 3D-First person games, and have since AR. I remember staying up late at night, in the dark, with AR rain and the crash of the thunder and flashes of lightening. At any rate, the PC version I've always been disappointed with, but oh well.

I laughed for days the first time I was mapping The City, and figured out that a section of the city spelled out "Philip Price" I'm still chuckling today. (Ok, thought not with the great guffaws of past.)

At any rate, I've always been tempted to re-create The City level in Doom. I've always wondered if anyone out there has already done it. It would be wierd to go around blasting demons near the Floating Gate though..hehe..

Oh, what was the final answer to everything supposed to be?

And good luck, Mr. Price. Your influence in the lives of many people has probably extended farther than you will ever know. :)

Hello Michael Current <MCURRENT@carleton.edu>,

I have read your list of vendors, publishers etc. You have left one publisher out! That is the Dutch publisher of the Pokey Magazine. This is a magazine that is published 6 times a year. A subscription costs (for the Netherlands) 37,50 guilders. The magazine is published by a foundation called 'Stichting Pokey'. This organisation does not make any profits. It is purely for the Dutch Atari 8-bit users.

I am the treasurer of 'Stichting Pokey' and do the lay-out and printing of the magazine. Articles are written by me, ANG and various other Dutch users.

The address: Stichting Pokey
Postbus 425 (that is P.O. box 425)
2920 AK Krimpen ad IJssel

Message-ID: <1995Jun27.212225.25692@wariat.UUCP>
Source record: 90441

Ok, so I started blinking my eyes with my statement that BobTerm
corrupted files. I put away my ST and unpacked the 8-bit and started
null-modeming again. I could not 'reproduce' the flaky results I got
that day with BobTerm and Procomm Plus. I was wrong about using
external dsz, that's a true y-modem g protocol. I had to have been
using the Y-modem (batch) in both BobTerm and Procomm Plus. I remember
trying two or three times and getting botched up transfers. But, today,
I transferred 12k, 48k and 97k files from PC to 8-bit and every
transfer was correct. I guess I must have this NEED to say sensational
things without checking it out. Sorry Chris and everyone else.

|> which adds PAL compatibility (ie, run European-based software which messes up
|> or doesn't run on US machines)

I have the PAL ANTIC installed in my 800XL at the moment. Those European demos run MUCH smoother. The screen does flicker (at 50 Hz), which my monitor keeps up with okay. COLRVIEW still works, with just a bit more flicker to it. I haven't tried FlickerTerm, or other terminal program yet for compatibility.

I am using the US+ OS, not Nir's custom OS, and everything has worked so far.

I've done several and have fixed another persons mistakes (twice).
Errors in the instructions??? I know of no outright Erros but a few points are
not very clear. What I did do was do a line by line re-write of the point to point
wire tabs. I think I also worked out a couple of better places to route one or
two wires. I'll have to look in my files and see if I rewrote the wire tabs on the
computer, I don't think I did. If anyone is interested, I write them up and upload
them someplace.
Humm, now that I think about it, there is a diagram that I followed
and I don't have anyway to include it. I made a couple changes on that, too.
Get to me with EMAIL and in the meantime I'll dig out my save upgrade paperwork.

Well I use Bobterm 1.20 or was it 1.21 I'm not sure....
But I tranfer many file from my AMIGA and Atari 8-bit with 2 modem,
one 14k4 on my ATARI PRO BBS and a 9600 baud on my AMIGA and connect
the two phone jacks.... And I not have any problems at all....
And I do it already for a long time..... NO problems....

The company manufactures a console and designs games for their own
machines (this should leave a few possibilities;). It is only one of three
companies I have ever sent my resume to in the last ten years, and it was
through one of their programmers who knew and greatly respected my work
that initial contact was made(ie. without his initiative I wouldn't have
sent my resume and would have just stayed in my comfortable corporate job).

The business can use as many creative people that they can get thier
hands on. The production values of games have greatly increased over the
years, but playability has not kept pace. But most lacking is the art of
grabbing someone's heart and stomach and giving them the ride of a
lifetime. Since I live and breath games, have been a student of a
plethora of the arts and sciences I hope to contribute what I am allowed
to to provide that thrill to fellow gamers.

Has anyone tried to work DOSXE-based disks with SIO2PC.

If I boot my real drive with DOS-XE, I cannot copy files onto a non-DOSXE disk; and if I boot up with MYDOS45.ATR on my 'image drive' i can't seem to read my DOS XE DISKS....

I have quite a bit of stuff in DOS XE format and I want it off and onto anything else. (i.e. mydos4.5, dos 2, etc...)

Anyone have any ideas. Even ones that won't work will be appreciated.

-thanks in advance.

I've been using a hard-wired null modem through my P:R: connection, and
everything that I transfered worked fine. Of course, why anyone using a
null conection would bother with Xmodem is beyond me.. Y-modem batch or
Zmodem is better. I only use 1K-Xmodem as a last resort, and never plain
old Xmodem.. I dropped Xmodem when I stopped using SX212 Express! ...

I'm afraid I'm not a hardware hacker, but there are plenty of them active around here. I'm sure you will get a detailed answer soon. In the meantime, you should do a Web search on "Atari" and find the "8-Bit Homepage". Sorry, I don't have the address handy, but the fellow maintaining it has sections with all the tech info: maps, bus and interface pinouts, etc. I can say that in general the Atari 8-bit design uses the low and high parts of address space for OS and BASIC. I believe the LOWMEM boundary is about 2K and the upper system area starts at 48K. Get the info, though, because there is all kinds of OS routine support for the kind of things you will be wanting to do.

>And ultimately, can I copy my boot cassette programs to floppy
>disk? How is this done. Thanks,

I see you've alread had at least one helpful response, so I'll skip the
basic answers you already have.

I'd recommend you stick with Atari DOS 2.0 or 2.5 (which MUST be
on some of those disks you got) for a while. No, it is nothing like
MS-DOS, but it is a simple, menu-driven system which I'm sure you
can figure out. As was mentioned, the procedure is to turn on the
drive, insert the disk, then turn on the computer. You will have to
experiment with each disk to see if it wants BASIC (just turn on the
computer) or if it wants BASIC disabled (hold OPTION).

In either case, the software may take over and start on its own, it
may present you with a custom menu, it may leave you at the DOS
menu, or it may leave you at the BASIC "READY" prompt.

Another thing which might mess you up is the drives must each have
their drive number switches in back set to different numbers 1-4, and
you must boot from drive 1.

As to copying your cassettes to disk, there are utilities for doing this
for machine language boot cassettes, but they may be a bit hard to
find (I haven't had to do this in a LONG time), and if the binary soft-
ware is at all complex (like it loads in several stages--a welcome
screen, then the game, for example) the utilities I've seen probably
won't handle it.

One additional set of details is that Atari DOS 2.0 or 2.5 consist of
two binary files on a disk (plus the invisible boot sector infomation).
These are DOS.SYS and DUP. SYS. The procedure is conceptual-

ly similar to MS-DOS. A disk may be formatted, but it is not bootable unless menu item "H", Write DOS Files is used to write the boot sector as well as DOS.SYS. DUP.SYS is necessary to have the DOS menu available.

Hope some of this is of help.

Joel; In some versions of AR City, ST for sure, you could work & I think if your stats were high enough join guilds. I never got a character advanced enough to join a guild in the ST version though. It was a fairly decent port all things considered but that drowning boom box sound for the music came across more like distortion then something planned. There was at least one great bar to go to in the outer perimeter of the North West corner I think. You had to go through something like 18 one way walls, turn right & go through an invisible wall to get there. It was the only place in town that gave out free water.
I'm still wonder what some of the back doors like: Chronos Master of Time do.
Rick

790. Sequels to Alternate Reality

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-28 00:00:00 UTC

Just curious...The Dungeon was the last (and only) sequel released to AR:
The City...but there were more modules in the works, right? Like the ones
you run smack into in the City: The Arena, The Palace, The Wilderness,
The Casino...any chance at all that these will ever be made? I mean, is
there a "Dungeon Creation Kit" for AR or is it all coded from scratch?

The ATARI XF-551 spins at a physical rate of 300 rpm, but will report
a query as 280 rpm for compatibility (I think ?). If the program computes
revolutions directly, you will get 300 rpm because I understand that the
mechanism is a regular IBM clone Mitsumi (sp?) floppy drive.

Make an offer on this fine performing printer system. Prints great cassette jackets with the CASSJCKT.BAS basic program.

Star SG-10 printer - Does tractor feed or friction feed for stationary and envelopes. Uses charater sets to allow graphics printing. Originally considered "the" printer for Atari computers. Original box, packaging and manual included. *NOTE* - will also work with ST or other computers with a standard parallel cable.

Dust cover specifically designed for the SG-10.

Desktop printer stand - Elevates printer on desk so paper can be stacked under it.

Printer interface - Digital Devices 8-bit printer interface which allows other devices to daisy chain off of it.

Misc. - Paper, extra ribbon.

Cleaning out some storage....

I have an ORIGINAL ATR8000 drive controller.... drives as well, if I recall correctly. The ATR8000 allows 8-bit users to use stock 5.25 in mechs. Etc.

It worked when I stored it.

Will sell for $25, plus shipping. Will sell drives (if I still have them) for $25 also.

email please. I don't keep up on this newsgroup.

Source record: 90469

Winter Games (from Epyx) was never officially released for the Atari 8-bit range of computers, however there were several other winter sports sims, some good some not so good.

Perhaps one of the better ones was a game called Winter Olympiad 88 which was released here in the UK just before the Winter Olympics of 1988 by a company called Tynesoft. Several months (years?) later well after the 1988 Winter Olympics had finished this game was released in the USA by a company called Thunder Mountain, but to avoid the product being dated they changed the name to Winter Challenge. Therefore Winter Games (and Summer Games 2) never made it but there are several worthy alternatives.

The city had a poster size map printing and an interactive editing
program I creating for development purposes. Also the atari 8 bit city
allowed bootstrapping the sequels directly from the city without rebooting.
In order for someone to trick AR into believing that they had an arena,
they would have to define a floppy the fit the expected format for arena
and then AR city will blindly load into memory sectors from that
disk(assuming again they all are properly formatted/structured) and then
jump to a location in memory that is in the loaded area.

Its been a long time(and I haven't booted my code disks) so I can give
a foggy picture of the required data layout of a sector for the city and
any other bootable sequel (This does not apply to the commercially
released dungeon because the
bootstrap feature was never implement on the c64 conversion of the city and
therefore the dungeon did not have it).
But the layout went as follows:
Byte 1 & 2 Two integer values used for seeds for the encryption
algorithm. The rest of the sector was encrypted including the header.
The order of the following bytes is not assurdly correct(Hey it's eleven
years since I wrote it;D
Byte ID of which game in the AR series this disk is part of
Byte ID of which disk "side" in the game/sequel this is.
Track ID no disk (Used to prevent people copying sectors around to
see what that would do)
Sector ID on disk
Two byte checksum (this is the last thing, I believe it was two, not one
byte)
120 Bytes of Data

Byte the way one flaw in my simple block-chain cipher I used is that if
you have both seeds be zero, then the rest is the same(I think unless I
added the last data value into the seed, ugh, been a while) as if
there was no cipher:)[It used a simple xor and addition/modulo technique
changing the working key as it went]. The encryption and decryption
algorithm is also the first thing my VBI worm would consume if it was
brought to life by someone flipping on Omnimon into memory.

PHILIP.PRICE at 01:48 EST

Okay since I am a notorious procastinator. I will give a brief outline of
what was the main parts of AR as originally conceived.

The idea behind AR was a place to entertain but also to enlighten/educate
oneself. I desired to have as realistic of a world possible, but still a world
that was filled with the unknown. I knew I couldn't do it in one product so I
plan to develope it through a series.

City/Dungeon (Something originally planned as one)
You are thrust into a new enviroment and have to first learn to survive.
You have to learn to discern to a certain degree. Free will is of course
permitted, monsters and people react to your moral decision. Traps are laid
both physical, mental and moral. Multiple ways to resolve problems are
avaiable. The first clues to why things are the way they are are given.
[Further details on the clues I will disclose further in this letter].

Arena
Originally game would be patched to add slaver bands. (you could be shang
hi 'ed into the arena amongst oither ways in).[Original game meaning
City/Dungeon]. The arena would permit combatting you characters against other
peoples characters or against computer run characters. The ultimate goal if
you had been abducted would be to regain your freedom, if you are free then it
would be to gain nobility and a title. A choice would be given if this wqas
accomplished that would retire that character to a life of luxury[and
boredom].

Palace
Palace intrigue and the ability to modify the city layout. You could climb
the ladder to greater power and responsibility, wielding it as you saw best or
worst. Again if you climbed to the pinnacle you had a option to retire the

character to a life of luxury,power and the thrill of trying to stay one step ahead of future wouldbe kings.

[To become king you have to defeat the current king which at first is a computer character, though once overthrown or disposed/killed/poisoned etc. it would be someone else, possible a player character[retired].

Wilderness The wilderness would be the start of a pilgrimage to find the truth of AR. There would be traps,tricks to waylay the adventure and to turn him from his or her's true quest.

Revelation Hidden in the depths of a cave behind the immense waterfall that can be seen even from the city is a metallic door requiring a pass card to enter. Once open it reveals corridors gleaming with technology far beyond our own. Further investigation reveals a room that has immense windows/portals and a view, a view into space.

Destiny Fighting with high tech equipment (from both revelation, destiny and if you run into the aliens that politically are friendly to you plight, the weapons the riddler has from the dungeon). Searching further this immense ship you discover a chamber filled with metal cocoons. Using wit and knowledge gain through other locations you decipher the controls and the display. You learn that these cocoons hold bodies, the bodies of all of those captured. The machines keep the bodies physically alive and fit, but imprisoned. The minds of those entrapped are tapped and fed with images. The ships computer can even permit the images to interact with solid/material components of the ship. You are an image. What is reality? You body lies in a cocoon. Your mind sees what the image sees. What is a soul? What is experience? You experience, you feel what this image you have been controlling since you kidnapping feels. Again there are choices to make. In the end you are left with many choices, continue to live in you image body, a nearly immortal life, but knowning that these aliens have done this to you and can watch, feel, experience whatever you do whenever they want. You are thier entertainment. They have become jadded by luxury , power and knowledge and use lesser beings to regain some of the passions of life. You can cut off this channel, though they may also destroy the ship, or earth. You can escape in a smaller ship than the entertainment world and go back to earth (hoping to evade the future capture ships these beings send to gain more 'entertainment'. You could destroy the planet[and hope that they are not a multiplanet race] You can take the entertainment world(That was orbitting the aliens planet) and bring it back to earth to let the scientist learn from it[and hope the aliens don't trace it]. You could blackmail the aliens. You could sell out humanity. You could try to bluff them. There are many choices, life isn't easy and some of the most important decision are the hardest to find a best answer in.

There were other details I haven't gotten into here(Like a lot of the fun things to do in each scenerio other than the main plots). And there were/are a lot of little details to be left until the scenerio each were to be produced. But from this you can see the main plot and the main suprises that were originally planned.
Take Care,
Phil P.S.

I think I have mentioned this before...FOr Atari 8 bit City owners if you type fiat as you character name(while holding down the control key) you get into another menu which allows some game changes. The only command I remeber from it allows changing the speed of the numbers spinning by before you walk through the portal. the command is cela saute aux yeux. I hope I spelled that right.

Acrinimirils gate was a portal into a true parrallel universe. Acrinimiril was/is a being from another universe, who had a habit of adventuring/travelling into many dimensions and universes and getting himself into heaps of trouble. He was a complete unknown to the aliens and caused them all sorts of problems. For one since he wasn't run from the computer, he was not traceable. Also he had a lot of experience in these situations. Unfortunantly isn't wasn't always very bright about keeping a low enough profile. And after killing an alien (and getting it's passcard) the aliens were then able to trace him and finally entrap him for further study. Not all aliens were for this 'entertainment', and there was planned to have ways to resolve the ultimate questions through interaction with these aliens also. And it was also was going to be allowed to go through acrinimirils gate into other universes at destiny's end.

---------- End of Phil's meesage

Bernard; IMO, if there is a problem it will be with the software on the recieving end. An ST with Omnicom for instance will pick up extra characters with a xmodem transfer. The easiest way to check for potential problems is just send a small text file with the set up/protocol you want to use, then load the file into your word processor. If it is normal except for a trailing string of repeating characters, then this is the bug people are talking about. I've had it happen repeatedly with files I created myself so I know it's happens. I'd imagine since a lot of us used this ST/Atari set-up to port files back and forth we may have inadvertantly created a lot of files like this.

810. How do I make a ROM image?

I was wondering if the SpartaDos Disk Image for PCXformer is available yet.

If so, where can I find it...

Also will this disk image support a full SpartaDos Hard disk partition???
(Which is if I remember correctly 15 megs?)

If this is available I will buy PCXformer in a heart beat...

Unfortunately the software I'd like to run on my PC requires SpartaDos 3.2.

Thanks for any information...

>port files back and forth we may have inadvertantly created a lot of files
>like this.

I used to run a BBS in Augusta,GA years back and had this problem a lot. I
wrote a program to strip off the extra trailing characters called STRIPPER.
Then I found that while this worked most of the time, once in a while it
didn't. The reason is I was just removing all the characters at the end of a
file that were the same. Fine, but sometimes the characters added in transfer
were the same as the last character in the file. In that case when they were
removed, the file would still not work. I wrote STRIP2 for this case, then
later combined both into STRIP3 so you could write both versions of a file and
try them. At that time, (1985-86) most xmodem protocols had this problem.
The nice thing is that the file is only corrupted once. From the point of the
first transfer, the file is evenly divisible for following transfers and no
more extra characters should be added. I will put it up on James King's
xmission FTP site for those interested. ftp.xmission.com
/pub/users/j/jeking/8bit.

Ah, Alternate Reality. 10 years later, after having played so many games with much better graphics & sound, much larger worlds, and so many more options, I *STILL* say AR was the most addictive game I ever played. Damn shame it never got finished...or at least revived in a new version for PC & Mac.

...and the songs were the best. I find myself still humming the opening music every now and then unconsciously. Damn, I gotta plug in the old 800xl and visit the taverns again. :-)

Phil, if you've got a few spare minutes, could you please do all of us AR fans one really big favor? Please post a quick paragraph or two letting us know how the game was supposed to end. (ie - how you finally get back to earth, why the aliens captured you and brought you to Xebec's Demise, etc).

Heck, we've been waiting 10 YEARS for the answers to these questions! :-)

>Man Philip.. I bet you not only changed the lives of the players of AR, but
>you probably REALLY humbled many hackers who tried to cheat the game!! :)

Back in those days, in my high school years, any time I bought a game
or borrowed a copy from a friend, the first thing I did was try to
copy it. (no long flames about piracy please; yes I used to copy lots
of games, but I also spent quite a nice chunk of money purchasing
legal copies of games I really liked as well...that includes AR which
I mail-ordered after reading an interview with Philip Price in Antic
like 6 months before the game was released). Anyway, I got pretty
good at cracking copy protection schemes on games. On lots of games
I enjoyed cracking them more than playing them! Alternate Reality-City,
with it multi-stage loading, and multi-level encryption scheme,
fuzzy sectors, and more ("protection from paradise") was one that I
spent *days* on, and couldn't beat. [and the Dungeon was cool too,
if I recall - the first level of copy protection was a simple
flawed sector or something....go in and remove the sector test and
when you tried to boot the copy it would put up a screen admonishing
you for pirating :-)]

Luckily I did finally get a cracked copy about 2 years later. I say
luckily, because my original side 1 disk for the city became
unreadable after about 3 years.

An Antic article describing a bit of AR before it came out said that it's in theory possible to finish the game with just part 1, but you have to look a weird things like star patterns... has anyone figured out if there's any way to finish the game from part 1?

Oh I dont doubt that, However I do remember seeing a fully working copy
of the game on various BBS's before it was in any of the stores in the
area. No matter how well copy protection is, there is always some hacker
out there with a mix of the cracker mentality, that has more time than
you'de imagine, that will have the game cracked within 3 or 5 days of
recieving it.
Some even went through the gory details of patching some of the
European games so that they'de be playable on the NTSC 8bits. I
remember playing Gauntlet (US Gold Version) years before it was ever
marketed by Mindscape in the US; although the game would usually crash
after 5 minutes in 2+ player mode.
Some of the hackers even worked on multi-platform cracking. I believe
the hacker who cracked a large majority of Atari games known as "Kilroy"
used to run several bbs's -- one for the Atari 8bit, one for the C64, and
one for the Apple II. He cracked games on all of these platforms.
Nothing like being a knowledgable teenager with too much time on your
hands. (grin)

>Any of you guys know what happened to the great atari writers like Ron J
>fortier, Randy glover, chris crawford etc etc

Actually, I just ran across an interesting old-time Atarian. The name
Adam Billyard may not ring a bell, but he wrote:

Bellum - a Scramble-like game for APX
Henri - a Mr. Do clone
Chop Suey - a one-one-one fighting game (eventually sold through Antic's
APX)
ElektraGlide

He went on to write a couple of ST games and, most significantly,
RenderWare, which is one of the currently hot Big Three of PC libraries
for writing 3-D games.

I think it can. There is a limit on the number of LINES it tries to display at one time, but you can get very large levels.

Just my two cents; where the Hotels are, put the blue health spheres, where the taverns are, put perhaps blue potions, and where the smithys are, put armor... If you can Uuencode it and mail it to me, I'd be glad to give input. (I just haven't had time to do any WADS lately.)

ObAtari8bit: I started out with an Atari 800. The 800xl I migrated to died a few years back, and I had sold my old 800 years ago. I have no Atari now.

Source record: 90497

Well, someone mentioned they would like to play an AR doom game..
well, the best that can be done right now is to make a DOOM AR City
map and populate it. =)

My younger brother is working on it right now... (there are AR maps
all over the walls of my computer room!).

However, we aren't sure if the doom editor can handle a map this large..
and this detailed. So, I can't promise you that you will ever see
a completed City.

Um..any sugestions as to what you would like to see?
We just argued that it would be better to allow you to use the built in
mapping feature of doom... otherwiase it would upset those people
who have no real RPG experience ...that and its VERY difficult to
figure out where wall sections begin and end with the DOOM textures.

Well, I just played aroound with the floating gate..pretty cool...
Gotta go... this machine is going to be on for the next few days non-stop.
heheh..

And yes, AR is the best game I have ever played...(RPG genre... there is
of course TEMPEST...)

I remember when and how that rumor started.. But to hit the nail on the
head, without further sequels, which would have patched the city, it can not
occur.

I've written a simple 6502 macro assembler in c (OS linux).
The only thing i have to now is where i can upload it.
(don't say umich, it's way to slow)

Doesn't matter if MAC65 does it or not, because you won't get a full ROM
image if you do it this way. You should write a small program that writes
the $C000-$CFFF ROM region to a file, then clears bit 7 of $D301 and write
$5000-$57FF and finally write $D800-$FFFF. This will produce a file of
exactly 16KB.

bye,
Ivo

835. Re: 800XL D.J.

Newsgroup: comp.sys.atari.8bit

Message-ID: <DAzEso.EM0.0.-s@cs.vu.nl>
Source record: 90504

CALLUM.LERWICK@f47.n282.z1.fidonet.org (CALLUM LERWICK) writes:

>I just downloaded 800XL D.J. from a.a.u.e, it appears to be a program
>similar to SIO2PC, exept it works with ST's. But I can't figure out how to
>make it work as all the doc's are in German! (but the program itself is in
>English) Someone help please!

I have it installed at my STE together with a cable called ST/XL-link or
something... it consists of a MAX232 and 4 capacitors (sp?) and it only
links the send, receive and ground lines of the SIO port and the RS232
port. The command-line is not feeded to the ST, so sometimes you get a small
synchronazition (sp?) problem. Anyway, I guess the program will also work
with the SIO2PC cable (never tried). 800XLDJ is a nice program. It will let
you have up to 8 (or was it 9?) emulated drives in all different formats
(i.e. 256 bytes/sector single sided, double sided, 40 or 80 tracks etc.)
Also, one can install a read only drive which gets its files from C:\TMP
i.e. one has direct Harddisk access. All together, it's a nice program,
but it lacks the ability of transfering files in and out of disk images.
That's why I still stick to my old and trusty and severely hacked piece of
software from the 'Brabantse Hardware Freaks' that runs as interpreted
GFA basic, only emulates 2 drives and a printer, but can convert files
out of a DOS 2 (!) image to my atari harddisk....

836. Re: Copying a boot Program on a Cass to disk

Newsgroup: comp.sys.atari.8bit
Date: 1995-06-30 00:00:00 UTC
From: sharris@bobcat.ent.ohiou.edu
Message-ID: <DAzLG0.5r3@boss.cs.ohiou.edu>
Source record: 90505

Thanks Gary for the technical and moral support. I hope my return
to vintage Atari comps will not be too difficult. I have one
question though from what you said. Do DOS and Basic run concurrently?
Or do you have to go from one into the other?

14.3) Where is my nearest 8-bit Atari user group?
14.4) How do I use my new or emulated Atari?

14.5) What prominent Atarians are reachable by e-mail?

Subject: 1.1) What is an Atari 8-bit computer?

In order of their release, the Atari 8-bit computers include the 400,=
800,
1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System. The 400/8=
00
models were first shown publicly in November 1978 and first sold in
1979. The final machine, the XE Game System, was released in 1987.
Atari Corp. officially dropped all remaining support of their 8-bit
computer line on January 1, 1992.

The following text was written by Chris Crawford and appears in De Re
Atari (Atari#APX-90008), a book published and copyright by Atari, Inc=
.,
1981-1982. It has been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very differe=
nt
=66rom other systems. It of course has a microprocessor (a 6502), RA=
M,
ROM, and a (PIA). However, it also has three special-purpose (LSI) c=
hips
known as ANTIC, GTIA, and POKEY. These chips were designed by Atari
engineers primarily to take much of the burden of housekeeping off of=
the
6502, thereby freeing the 6502 to concentrate on computations. While
they were at it, they designed a great deal of power into these chips=
.
Each of these chips is almost as big (in terms of silicon area) as a
6502, so the three of them together provide a tremendous amount of
power. Mastering the Atari 8-bit computers is primarily a matter of
mastering these three chips.

ANTIC is a microprocessor dedicated to the television display. =
It
is a true microprocessor; it has an instruction set, a program (calle=
d
the display list), and data. The display list and the display data a=
re
written into RAM by the 6502. ANTIC retrieves this information from =
RAM
using direct memory access (DMA). It processes the higher level
instructions in the display list and translates these instructions in=
to a
real-time stream of simple instructions to GTIA.

GTIA is a television interface chip. ANTIC directly controls mo=
st

of GTIA's operations, but the 6502 can be programmed to intercede and
control some or all of GTIA's functions. GTIA converts the digital
commands from ANTIC (or the 6502) into the signal that goes to the
television. GTIA also adds some factors of its own, such as color
values, player-missle graphics, and collision detection.

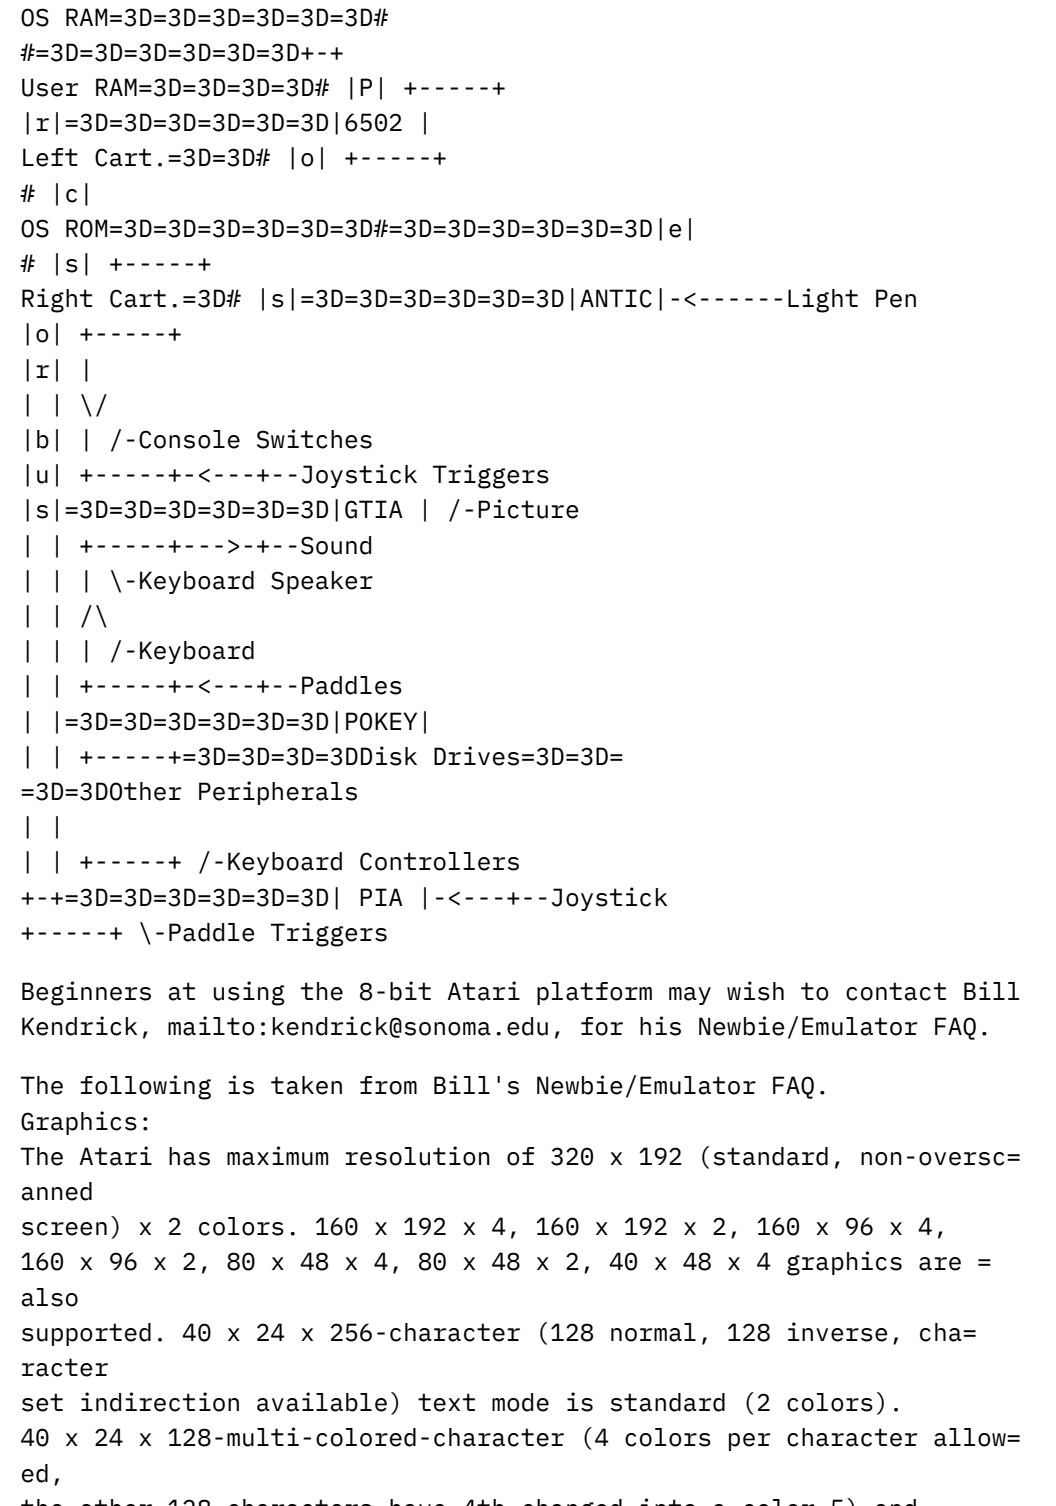
POKEY is a digital input/output (I/O) chip. It handles such
disparate tasks as the serial I/O bus, audio generation, keyboard sca=
n,
and random number generation. It also digitizes the resistive paddle
inputs and controls maskable interrupt (IRQ) requests from peripheral=
s.

All four of these LSI chips function simultaneously. Careful
separation of their functions in the design phase has minimized confl=
icts
between the chips. The only hardware level conflict between any two
chips in the system occurs when ANTIC needs to use the address and da=
ta
buses to fetch its display information. To do this, it halts the 650=
2
and takes control of the buses."

The 130XE and XEGS contain a small additional LSI called FREDDIE, a R=
AM address
multiplexor. . According to mailto:masstorage@closer.brisnet.org.au
(Masstorage), "Freddy is a type of memory controller. It takes the a=
ddress and
clock from the CPU and multiplexes it with the appropriate timings an=
d signals
to use DYNAMIC memory. Freddy also buffers the system clock crystal =
and
divides it down then feeds that to GTIA. The XEGS has a freddy but i=
t doesn't
have the extended RAM. Even if it did, you would still need the chip=
that does
the REAL bank switching. It is a small 16-pin chip (Atari/Best Elect=
ronics
catalog number CO25953: rev9/page 42). It gets RAS from freddy, the =
bank
select bits from PIA, A14, A15 and the 6502 halt signal to control wh=
ich bank
of 8 chips RAS goes to. A14 and A15 then go to freddy for the addres=
s range of
the extra memory bank (or normal address range with no bank switching=
). The
ANTIC/6502 select bits in combination with the 6502 halt line, contro=
l the
switching of the PIA bank number bits to A14/A15 and which bank of me=
mory RAS
goes to. Why people say freddy does the bank switching is beyond me.=

An 800XL
can look like a 130XE with that 16-pin chip installed (That's right N=
O freddy)
and an extra 8 RAM chips."

Hardware Arrangement



Beginners at using the 8-bit Atari platform may wish to contact Bill
Kendrick, mailto:kendrick@sonoma.edu, for his Newbie/Emulator FAQ.

The following is taken from Bill's Newbie/Emulator FAQ.
Graphics:
The Atari has maximum resolution of 320 x 192 (standard, non-oversc=
anned
screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4,
160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are =
also
supported. 40 x 24 x 256-character (128 normal, 128 inverse, cha=
racter
set indirection available) text mode is standard (2 colors).
40 x 24 x 128-multi-colored-character (4 colors per character allow=
ed,
the other 128 characters have 4th changed into a color 5) and

40 x 12 x 128-multi-colored-character screen modes are available.
GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-o=
nly,
and 80 x 192 x 9 color screen modes.
Graphics Modes Summarized:
Mode Horiz.xVert.xColors text/graphics
0 40 x 24 x 2 text
1 20 x 24 x 5 text
2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 2 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Normal (bordered), narrow (underscanned), and wide (overscanned) sc=
reen
modes are available.
Screen modes can be mixed (by lines) down the screen using the Disp=
lay
List (a program which is executed by the ANTIC graphics chip ever=
y
screen refresh (60 times per second on real NTSC Ataris).
Fine scrolling (both vertical and horizontal) can be enabled on any
line on the screen.
All other screen attributes (color, player/missile horizontal posit=
ion,
screen width, player/missile/playfield priority, etc.) can be aju=
sted
at any point down the screen via a "Display List Interrupt."
Four 8-bit wide, 128 or 256 byte high single color players, and fou=
r
2-bit wide, 128 or 256 byte high single color missiles are availa=
ble.
A mode to combine the 4 missiles into a 5th 8-bit wide player is =
also
available, as is a mode to XOR colors or blacken out colors when =
players
overlap (good for making three colors out of two players!) Playe=
rs
and missiles have adjustable priority and collision detection.

Sound:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 =
and 4)
can be combined to make 16-bit pitch-resolution. Also 4-bit volu=
me-only
modes can be enabled for digitally sampled sound replay.
A fifth "voice" is produced by the internal speaker on Atari 400/80=
0's
(for keyclick and buzzer) and in the XL's and XE's this was
(fortunately!) rerouted through the normal audio output, and the
keyclick can be disabled.

[I'd like more system spec's here.]

Subject: 2.1) What is comp.sys.atari.8bit?

If you have Usenet newsgroup access you can access this discussion gr=
oup
through news:comp.sys.atari.8bit. This is an unmoderated newsgroup f=
or
discussion about the 8-bit Atari 400/800/XL/XE computing platform. A=
ll
postings to news:comp.sys.atari.8bit automatically appear in the
Info-Atari8 Digest and in INFO-A8.

comp.sys.atari was split into comp.sys.atari.8bit and comp.sys.atari.=
st in
approximately 1986. To the best of my knowledge, there is no charter=
for
comp.sys.atari.8bit, presumably because the custom of drafting charte=
rs
for new newsgroups did not exist at that time.

news:comp.sys.atari.8bit is archived by the INFO-A8 listserv.

Subject: 2.2) What is comp.sys.atari.announce?

news:comp.sys.atari.announce is the moderated Usenet newsgroup for ne=
ws
items and announcements related to all Atari computing platforms. Th=
is is
a low-volume, high-signal newsgroup, useful for reaching the widest
possible audience when making 8-bit Atari announcements. Moderated b=
y
Yat Siu from mailto:lexicor@world.std.com

Subject: 2.3) What is comp.sys.atari.advocacy?

news:comp.sys.atari.advocacy is the unmoderated Usenet newsgroup for
advocating for or against the various Atari computing platforms. If =
you
enjoy making comparisons between Atari 8-bit and other computing
platforms, this is the place to do it.

Subject: 2.4) What is comp.sys.atari.programmer?

news:comp.sys.atari.programmer is the unmoderated Usenet newsgroup fo=
r
topics in programming on the various Atari computing platforms,
including the Atari 8-bit.

Subject: 2.5) What is comp.emulators.misc?

news:comp.emulators.misc is the unmoderated Usenet newsgroup for the
discussion of emulating computing platforms on other computing platfo=
rms.
All emulator discussion that does not involve the Apple][, the
Commodore 64, or the WINE MS-Windows emulator (which each have their =
own
emulator groups) may be found on news:comp.emulators.misc.

Subject: 2.6) What is comp.emulators.announce?

news:comp.emulators.announce is the moderated Usenet newsgroup for
news items about emulating one computing platform on another. This i=
s
a low-volume, high-signal newsgroup, useful for reaching the widest
possible audience when making 8-bit Atari emulator announcements.
The moderator may be contacted at mailto:emulators-request@qualcomm.c=
om

Subject: 3.1) What is the Info-Atari8 Digest?

If you have Internet e-mail access you can access this discussion gro=
up
through the Info-Atari8 Digest.

The Info-Atari8 Digest originates from

mailto:atari8@netcom.com

Subscription requests should be sent to the above address with the su=
bject:

SUBSCRIBE | UNSUBSCRIBE (that is, one or the other)

The first line of the body of the letter should be the person's full =
name
followed by his/her mailing address. For example:

Mike Todd snyder10@convex1.tcs.tulane.edu

To contribute to discussion threads in the Info-Atari8 Digest, s=
end
your posting to mailto:comp-sys-atari-8bit@cs.utexas.edu. Postings s=
ent
here automatically appear on news:comp.sys.atari.8bit and in INFO-A8.

Note that any posting sent to mailto:atari8@netcom.com
will NOT be cross-posted to news:comp.sys.atari.8bit. The Moderator =
is
presently working to correct this.

The Info-Atari8 Digest is archived by the INFO-A8 listserv.

Recent copies are also kept at
ftp://ftp.kendall.mdcc.edu/pub/atari/info-a8/ (147.70.146.36) by Jaso=
n
Duerstock.

The Info-Atari8 Digest Moderator is Mike Todd,
mailto:snyder10@convex1.TCS.Tulane.EDU

Subject: 3.2) What is INFO-A8?

If you have BITNET or Internet e-mail access you can access this
discussion group through INFO-A8.

The BITNET subscription commands are:
tell listserv at marist register <your real full name>
tell listserv at marist subscribe info-a8

The Internet subscription command is:
mailto:listerv@vm.marist.edu where the message says
subscribe info-a8 <your real full name>

To contribute to discussion threads in INFO-A8, send your posting to
mailto:comp-sys-atari-8bit@cs.utexas.edu . Postings sent here
automatically appear on news:comp.sys.atari.8bit and in the Info-Atar=
i8
Digest.

Any postings sent to mailto:info-a8@vm.marist.edu or to INFO-A8@MARIS=
T
will not reach news:comp.sys.atari.8bit, so don't send your postings =
there.

You may leave the list at any time by sending a "SIGNOFF INFO-A8" com=
mand
to LISTSERV@MARIST, or by sending a message to

mailto:listserv@vm.marist.edu that says "unsubscribe info-a8". Pleas=
e
note that this command must NOT be sent to INFO-A8@MARIST nor to
mailto:info-a8@vm.marist.edu .

The archive of comp.sys.atari.8bit, the Info-Atari8 Digest, and INFO-=
A8:

You can obtain a list of the available archive files by sending an "I=
NDEX
INFO-A8" command to LISTSERV@MARIST or by sending a message to
mailto:listserv@vm.marist.edu that says "index info-a8". These files=
can
then be retrieved by means of a "GET INFO-A8 filetype" command, or by
using the database search facilities of LISTSERV. Send an "INFO DATA=
BASE"
command for more information on the latter.

Recent copies are also kept at
ftp://ftp.kendall.mdcc.edu/pub/atari/info-a8/ (147.70.146.36) by Jaso=
n
Duerstock.

The INFO-A8 Moderators are:
HARRY@MARIST (A Harry Williams)
mailto:ravi@mcnc.org (Ravi Subrahmanyan)
mailto:billw@score.stanford.edu (Bill Westfield)

INFO-A8 was created on December 9, 1986.

Subject: 3.3) How can I access the Merit/UMich Archive by e-mail?

For more information on the Merit/UMich archive, see the section of t=
his
FAQ list on accessing this archive by FTP.

Downloading - BART

Brode's Archive Retrieval Thang - the Merit/UMich Archive e-mail file=
server

To learn about using BART to access the Merit/UMich Archive, sen=
d
e-mail to: mailto:atari@atari.archive.umich.edu . The subject of the
message doesn't matter, but let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minute=
s),
try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over=
the
Internet) and splits up large files into parts of about 30K or less.

Uploading

Simply uuencode the file, (please split it into parts of 60 K or less=
)
and mail the result to mailto:lenn@atari.archive.umich.edu (Jody Lenn=
). Please
name the parts in the subject line. This is really helpful as the pa=
rts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description o=
f
the file, etc. Shar files are also acceptable, but uuencoded is pref=
erred.

Subject: 3.4) How can I retrieve files from FTP sites by e-mail?

There are several general-purpose FTP mail-servers. These may b=
e used to
retrieve any files available from anonymous FTP sites on the Internet=
.

1) mailto:ftpmail@decwrl.dec.com with no subject line, and two-l=
ine
body with line 1 help and line 2 quit

2) mailto:ftpmail@grasp.insa-lyon.fr (body: help) Please, Europ=
ean
users only.

3) mailto:bitftp@pucc.princeton.edu (body: help or ftplist for a
list of anonymous ftp sites)

Of the mail-servers listed here, I recommend this "BITFTP" server. T=
o help you
get started using it, try this example of retrieving files from the M=
erit/Umich
Software Archives (through the barnone.citi.umich.edu mirror site). =
Send a
message to bitftp@pucc.princeton.edu that says exactly:

ftp barnone.citi.umich.edu
user anonymous
cd /afs/umich.edu/group/itd/archive/atari/8bit
dir
cd Telecomm
dir

```
get ft80v037.txt
get icet.txt
binary
get ft80v037.arc
get icet.arc
quit

4) mail BITFTP@DEARN or to mailto:BITFTP@vm.gmd.de (body: help o=
r
ftplist for a list of anonymous ftp sites) (Europe only)

------------------------------

Subject: 3.5) How can I post to Usenet newsgroups by e-mail?

There are a several 'public' mail/News gateways. Each one has their o=
wn
ways for addressing syntax. The three most common ones are:

Site: cs.utexas.edu
Syntax: newsgroup-name@cs.utexas.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp-sys-atari-8bit@cs.utexas.edu

Site: newbase.cs.yale.edu
Syntax: newsgroup.name-news@newsbase.cs.yale.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit-news@newsbase.cs.yale.edu

Site: decwrl.dec.com
Syntax: newsgroup.name@decwrl.dec.com
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit@decwrl.dec.com

Mail-to-news gateways of this sort tend to be overloaded.
Therefore, please do not use these gateways or any other similar
gateways if you can post to Usenet directly.

------------------------------

Subject: 3.6) How can I access the World Wide Web by e-mail?

Swiped from the WWW FAQ, which is maintained by mailto:boutell@netcom=
.com
(Thomas Boutell), here is how to access a web page by email:

mailto:server@mail.w3.org (preferred) or to
mailto:listserv@info.cern.ch (older address) containing
the following single line. (What you put on the subject line doesn=
't
matter; blank is OK. This line should go in the text of the messag=
```

e.)
You will receive as a reply a simple page intended to help you lea=
rn
more about the Web.

send http://www.earn.net/gnrt/www.html

Subject: 4.1) How can I access the Merit/UMich Archive by FTP?

The Merit/University of Michigan Software Archives hold a huge n=
umber
of files for many computing platforms, including the Atari 8-bit
computers. Our 8-bit Atari Archivist is Jody Lenn,
mailto:lenn@atari.archive.umich.edu ; the Atari Archive as a whole is
maintained by mailto:boydm@atari.archive.umich.edu (Mickey Boyd).

The convention for Anonymous FTP sites is to accept "anonymous" as =
your
username, and your e-mail address as your password. All of the
FTP sites mentioned in the FAQ list follow this convention.

Downloading (Try the site nearest you first)
---
a) ftp://atari.archive.umich.edu/atari/8bit (141.211.120.11, United=
States)

b) ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit
(128.252.135.4, United States)

c) ftp://src.doc.ic.ac.uk/computing/systems/atari/umich/8bit
(146.169.2.10, United Kingdom)
d)
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atar=
i/8bit
(129.69.8.13, Germany)

e) ftp://ftp.orst.edu/pub/mirrors/archive.umich.edu/atari/8bit
(128.193.4.2, United States)

f) ftp://barnone.citi.umich.edu/afs/umich.edu/group/itd/archive/ata=
ri/8bit
(141.211.128.22, United States)

g) ftp://phlem.ph.kcl.ac.uk/pub/Atari8bit (137.73.4.24, United King=
dom)

h) ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
(147.70.146.36, United States)

Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

Uploading

Place uploads in ftp://atari.archive.umich.edu/atari/8bit/New

No uploads may be made to the Archive's mirror sites.

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text f=
ile
describing what your upload is, so our 8-Bit Archivist will be sure t=
o place
it in an appropriate permanent directory.

Note that the 8bit/New directory is "write-only."

Newly uploaded items may be found in the 8bit/Newitems subdirectory.

Subject: 4.2) What is the Boston Archive?

Here's an 8-bit Atari FTP site located at Boston University. It=
is
maintained by Adam Bryant, mailto:adb@albert.bu.edu . This site seem=
s to
have seen no uploads for years, but there are some files here that ar=
en't
on any of the other sites.

ftp://cs-ftp.bu.edu/PC/ATARI (128.197.13.20)

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by Eyvind Bernhard=
sen,
mailto:eyvind@lise.unit.no . PVV stands for ProgramVareVerstedet, or=
The
Software Workshop, a student society at the University of Trondheim, =
Norway.

ftp://nova.pvv.unit.no/pub/Atari/8bit (129.241.36.207)

Uploads go to ftp://nova.pvv.unit.no/incoming/atari/8bit; Eyvind move=
s
them to the appropriate directory. Please include a .readme file wit=
h
each upload, so people know what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

This smallish 8-bit Atari FTP site is maintained by Kevin Atkinson,
mailto:kevina@clark.net .

ftp://ftp.clark.net/pub/atari (168.143.0.2)

Write to Kevin for uploading instructions.

A mirror of the ClarkNet Archive, kept by Jason Duerstock:
ftp://ftp.kendall.mdcc.edu/pub/atari/clark.net/ (147.70.146.36)

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atar=
i
8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, =
The
Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the Closer To Home Archive?

Here is a fairly large FTP site in Australia kept by
mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears).

ftp://closer.brisnet.org.au/pub/archive1/8_bit (203.4.149.97)

Support site for James Bradford's Super 8-bit Products including Supe=
rDos,
SuperRam, Super800<->XL and much more.

Uploads go in ftp://closer.brisnet.org.au/pub/incoming

Subject: 5.1) What is the Cleveland Free-Net Atari SIG?

The Cleveland Free-Net is the hub system of the NPTN, the Nation=
al
Public Telecomputing Network. It can be accessed by any of the follo=
wing:
telnet://freenet-in-a.cwru.edu, telnet://freenet-in-b.cwru.edu, or
telnet://freenet-in-c.cwru.edu (129.22.8.32 or 129.22.8.51).
Type "go atari" to reach the Atari SIG.

Those who add their names to the Atari SIG user directories are
automatically members of the official Atari user group C.A.I.N. - Cen=
tral
Atari Information Network.

The Cleveland Free-Net Atari SIG publishes the CAIN Newsletter, maint=
ains
the CAIN Home Page on the WWW, and keeps the "Who's Who in the Atari
Community E-Mail Directory" listing. Send correspondence and press
releases to mailto:xx004@cleveland.freenet.edu .

Subject: 5.2) What is the Youngstown Free-Net Atari SIG?

Youngstown Free-Net (Youngstown, Ohio USA)
telnet://visitor@yfn.ysu.edu (192.55.234.27)

Type "go atari" to reach the Atari SIG. Write to
mailto:xx140@yfn.ysu.edu for more information.

Subject: 5.3) What is the National Capital Free-Net Atari SIG?

National Capital Free-Net (Ottawa, Canada)
telnet://guest@freenet.carleton.ca (134.117.1.25)

Type "go atari" to reach the Atari SIG. Write to Christopher Browne =
at
mailto:aa454@Freenet.carleton.ca for more info.

Subject: 5.4) What is the Closer To Home BBS?

Kept by mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears), this =
is a
BBS in Australia which supports the 8-bit Atari.

telnet://guest@closer.brisnet.org.au (203.4.149.97)

Subject: 5.5) How can I access the World Wide Web by Telnet?

This section swiped from the WWW FAQ, which is kept by
mailto:boutell@netcom.com (Thomas Boutell).

An up-to-date list of these is available on the Web as
http://info.cern.ch/hypertext/WWW/FAQ/Bootstrap.html and should be
regarded as an authoritative list.

telnet://telnet.w3.org
A telnettable browser provided by the W3 coalition.

telnet://www@www.cc.ukans.edu
Offers Lynx, a full screen browser which requires a vt100
terminal. Log in as www. Does not allow users to "go" to
arbitrary URLs, so GET YOUR OWN COPY of Lynx and install it=
on
your system if your administrator has not done so already. =
The
best plain-text browser, so move mountains if necessary to =
get
your own copy of Lynx!

telnet://www@www.njit.edu
(or telnet 128.235.163.2) Log in as www. A full-screen brow=
ser
in New Jersey Institute of Technology. USA.

telnet://www@www.huji.ac.il
A dual-language Hebrew/English database, with links to the =
rest
of the world. The line mode browser, plus extra features. L=
og
in as www. Hebrew University of Jerusalem, Israel.

telnet://sun.uakom.cs
Slovakia. Has a slow link, only use from nearby.

telnet://www@info.funet.fi
(or telnet 128.214.6.102). Log in as www. Offers several
browsers, including Lynx (goto option is disabled there als=
o).

telnet://www@fserv.kfki.hu
Hungary. Has slow link, use from nearby. Login is as www.

Subject: 6.1) How can I retrieve files from the Merit/UMich Archive t=
hrough
Gopher?

The Merit/UMich Archive has a native Gopher server. Try

gopher://gopher.archive.merit.edu:7055/11/atari/8bit

to connect directly to the Merit/UMich Archive's 8-bit Atari director=
y. I
personally recommend this method for downloading from the Merit/UMich
Archive.

There are also several mirror archive sites with Gopher servers:

gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit

gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit

gopher://gaia.ucs.orst.edu:70/11/g-i-s/computer/zftparea/mirrors/arch=
ive.umich.
edu/atari/8bit

Subject: 7.1) What WWW pages support the 8-bit Atari?

Atari 8-Bit Computers FAQ and Vendor/Developer Lists
Michael Current, mailto:mcurrent@carleton.edu
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/faq.ht=
ml

Atari 8-Bit Home Page
Ivo van Poorten, mailto:ipoorten@cs.vu.nl
http://www.cs.vu.nl/~ipoorten/Atari.8bit.Homepage/index.html

Atari 8-Bit Resort
http://www.uni-karlsruhe.de/~un55/8bit.html
Marek Tomczyk, mailto:Marek.Tomczyk@stud.uni-karlsruhe.de

Big Atari 8bit Home Page
Tomasz Tatar, mailto:tatar@student.uci.agh.edu.pl
http://www.uci.agh.edu.pl/student/airgrp/tatar/public_html/Atari/hp.h=
tml

Central Atari Information Network
Cleveland Free-Net Atari SIG, mailto:xx004@cleveland.freenet.edu
http://ace.cs.ohiou.edu/personal/mleair/cain.html

Rob Funk's pages
http://www.cis.ohio-state.edu/~funk/

CompuCat BBS
Neal Kinney, mailto:nkinney@netcom.com
ftp://ftp.netcom.com/pub/nk/nkinney/html/compucat.html

Classic Computer and Video Game Systems
http://www.gate.net/~cmwagner/atari8.html

Subject: 7.8) How can I access the Merit/UMich Archive by AFS?

If your local system supports AFS, this method of accessing the Merit=
/UMich
Archive is a breeze.

Downloading

Just copy files from file:///afs/umich.edu/group/itd/archive/atari/8b=
it/

Uploading

Just copy files into file:///afs/umich.edu/group/itd/archive/atari/8b=
it/New/

Subject: 7.9) What is #Atari8?

There is a channel on Internet Relay Chat for 8-bit Atari users. Its
name is #Atari8. Join #Atari8 on port 6667 (EFNet) and enjoy (if you
meet somebody there).

There should be a small bot called XE_BOT on this channel. While on
channel #Atari8 use the command
/msg XE_BOT help

for more information.

The latest information on #Atari8 and the XE_BOT may be found here:
http://www.uci.agh.edu.pl/student/robo1grp/tatar/public_html/Atari/ir=
c.html

Channel #Atari8 and the XE_BOT are the work of
mailto:tatar@student.uci.agh.edu.pl (Tomasz Tatar).

Subject: 8.1) What is the CAIN Newsletter?

The Central Atari Information Network Newsletter is the monthly onlin=
e
magazine of the Cleveland Free-Net Atari SIG. The editor is Mark
Leair of the Atari SIG. 8-bit computers support is provided by Micha=
el
Current and Craig Lisowski. For information, write to the Atari SIG =
at
mailto:xx004@cleveland.freenet.edu .

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all abou=
t?

UUEncode/UUdecode is a UNIX utility that will convert a binary f=
ile into
100% printable ASCII characters, so that the file may be posted or e-=
mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable=
of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
Merit/UMich: Archivers/uudecode.bas, Archivers/uudecode.doc
Boston: comm/uudecode.lst, comm/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
Merit/UMich: Archivers/yau.arc
Boston: comm/yau.uue, comm/yaue.uue, comm/yau.doc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
Merit/UMich: Utilities/uue.arc

Dumas UU-coder by John Dunning - should work w/BART-style split files=
.
Merit/UMich: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard ma=
nner that
is common in the MS-DOS world. This is done to make the file shorter=
,
so it takes up less space on your disk and it takes less time to tran=
sfer
between computers. The archives contains several 8-bit Atari archive=
rs
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
Merit/UMich: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc
Boston: {comm,util}/superarc.uue, {comm,util}/superarc.doc

Subject: 9.3) Okay, how about a .dcm file?

A .dcm file is a format unique to the 8-bit Atari which is used =
to convert
entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff.
Merit/UMich: Archivers/dskcom32.arc or Archivers/diskcomm.arc (same=
thing!)
Boston: {util,comm}/diskcomm.uue

Subject: 9.4) What is an .xmo file?

=2Exmo stands for XMODEM. The idea was that the file was not plain t=
ext,
but was a binary file. As a binary file, it had to be downloaded usi=
ng a
file transfer protocol such as XMODEM. The use of ".xmo" as a filena=
me
extender was popular once, but has been discouraged for years.

Subject: 10.1) What 8-bit Atari emulators exist for other computing
platforms?

These are the emulators that are usable.

1) ST Xformer 2.55, from Branch Always (see companion Vendor/Develope=
r
List for complete contact info). A freeware 8-bit Atari emulator for=
the
Atari ST.
Merit/UMich: /atari/Emulators/stxf255.lzh

2) PC Xformer, from Branch Always (see companion Vendor/Developer
List for complete contact info). The 8-bit Atari emulator for
DOS/Windows/OS/2. Versions 2.0 and 2.5 are freeware; 3.0 is the comm=
ercial
version.

The following further info on PC Xformer provided by Bill Kendrick,
mailto:kendrick@sonoma.edu . Contact him for his Newbie/Emulator FAQ=
.

2.0 emulates an Atari 800. It requires about 300K of
free memory, 320x200x256 (MCGA/VGA/SVGA) graphics, and a 286 CP=
U.
It does not support ROM files, disk image swapping within the
program, player/missile graphics collision detection, sound,
PC joystick support, modem/printer support, but is free.

2.5 is the replacement for 2.0. It emulates either an Atari 80=
0
or an Atari 800XL. It requires about the same as 2.0. It does
support ROM files and the PC speaker is used to emulate the old
Atari 400/800 internal speaker clicks. It is also free.

3.0 is the first commercial release. It emulates an Atari 800,
800XL, or 130XE (128K RAM; I heard it was to do 320K but I thin=
k
that was reduced). It requires a 386 and 512K of memory. It
supports Sound Blaster, player/missile graphics collision detec=
tion,
modem/printer and PC joystick support. It
comes with a disk with the software, an ammendum to the printed
documents, and a bunch of Atari 8-bit software (example program=
s:
demos/games, and a few useful utilities). It supports disk swa=
pping
through a (currently) simple menu.

All versions support .XFD (Xformer disk) format disk images, an=
d
all versions of PC Xformer support SIO2PC disk images (.ATR's).

PC Xformer 3.0 comes with a 36-page printed manual and referenc=
e.
It includes appendicies explaining graphics, sounds, colors, BA=
SIC,
subdirectory paths (for MSDOS which in turn explains SpartaDOS/=
MyDOS),
a quick keyboard reference, ATASCII characters (all 128 drawn o=
ut),
the Atari editor, error codes, file IO (commands, devices, XIO =
calls)
as well as giving breif information on how to contact other Ata=
ri

users, common file extenders, and it includes a LARGE glossary
explaining Atari BASIC / TurboBASIC XL commands, Atari computer
terms, and general computer terms.

Merit/UMich: Xf2/xf2.zip, Xf2/xf25.zip

Of importance to PC Xformer users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files i=
nto
SIO2PC .ATR's for use with SIO2PC and PC Xformer.
Merit/UMich: Sio2pc/dcm2dsk2.zip

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

BobTerm 1.22, shareware by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; excellent for BBSing
Merit/UMich: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sor=
t of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
Merit/UMich: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Combination VT100, XMODEM, Kermit; buggy at file Xfers
Merit/UMich: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Excellent at VT100 on the XEP80; 1200bps top speed
Merit/UMich: Telecomm/vt850b1.arc

FlickerTerm 80 0.37, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req=
'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability =
a minus
Merit/UMich: Telecomm/ft80v037.arc

Ice-T 2.0 XE (requires 128K) or 1.1 by IceSoft (Itay Chamiel)
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: XMODEM download
Autodial: Yes (2.0 XE) or No (1.1)
Backscroll buffer: Yes--8 screens (2.0 XE) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.0 XE) or No (1.1)
Summary: Excellent for high-speed VT100 emulation
Beta-test versions of both available from mailto:bruck@brachot.j=
ct.ac.il

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with a=
n
Atari-format diskette. The following require a DOS and disk drive on=
the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks=
.
Merit/UMich: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
Merit/UMich: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use M=
yUTIL!
Merit/UMich: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and atari=

dsk.arc)

MyUTIL by Charles Marslett and Mark Vallevand - The latest version!
Merit/UMich: Diskutils/myutil.zip
PVV: utilities/disk/myutil.zip

Here=D5s some advice on using the above utilities from mailto:hans@um=
d5.umd.edu
(Hans Breitenlohner):

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (280-some rpm instead of 300=
rpm).
If you format a disk on the Atari, then write sectors on the PC, i=
t is
possible that the header of the next physical sector will be overw=
ritten,
making that sector unreadable. (The next physical sector is usual=
ly
the current logical sector+2). The solution to this is to format =
all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)

2. If the PC drive is a 1.2M drive there is the additional problem of=
the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2=
MB,
and then reformatted on a 1.2M drive to 360k, can be read relia=
bly
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on th=
e
Atari for Atari to PC transfers, format truly blank disks on the P=
C
for PC to Atari transfers.

While the above work with SS/DD 180K Atari-format disks, the followin=
g
combination of utilities can be used to work with SS/SD 90K Atari-for=
mat

disks, and is currently the best bet for reading SS/ED 128K Atari-for=
mat
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
Merit/UMich: Xf2/anad207.zip, Xf2/anadisk.txt
Deana by Nate Monson - converts AnaDisk dump files from Atari format
Merit/UMich: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:preston.f.crow@dartmouth.edu ,
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari =
1050
drive or equivalent. Very limited.
Merit/UMich: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule=
.txt

b) SIO2PC, described elsewhere in this FAQ List (section 12.4), can b=
e
used to read/write to a hard drive connected to an MS-DOS system. Th=
is
can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the
companion vendor/developer list) allow the Atari XF551 disk drive to =
read
720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Softwa=
re
Services (see the companion vendor/developer list), allows both low
density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe
Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standa=
rd
floppy drives to be used on the Atari. A utility is included to
read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on each computer. The RS 232 ports need to be connected together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. (Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25-pin port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a male DB9 to male DB25 modem cable to connect to your modem. So why not use this cable as your null modem cable as well?

For higher speed connections, above about 9600 bps on the 8-bit, you need the flow control lines. You also need a Multi I/O or Black Box, which use the PBI (parallel bus), then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C port.
13 1
o o o o o o o o o o o o o
o o o o o o o o o o o o o
25 14

(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed
but also pins 4 and 5 as well as 6 and 8. Or better
yet, make a true 25 wire, straight through cable and use
a commercial null modem. A commercial null modem is
just a small device with the correct lines already
crossed.

(DTE =3D Data Terminal Equipment, i.e., your computer.
DCE =3D Data Communications Equipment, i.e., your modem.)

em
Only prototypes exist.

=3D=3D> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 177=
2.
Available formats:
=3D standard SS/SD 90 KB
=3D standard SS/ED 130 KB
=3D standard SS/DD 180 KB
=3D 'cylindric' DS/DD 360 KB (XF-551 uncompatible)
=3D 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.
Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 ki=
lo-
bytes per second with special track-copier.
Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.
Preferred systems: My-DOS, SDX.

=3D=3D> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB
- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF-551 compatible)
Transmission modes:
- normal 19200 bps
- Top Drive 1050 70000 bps
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not =
necessary;
full-compatibel with the SDX)
- Ultra Speed 70000 bps (full-compatible with the older SpartaDOS)
Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of =
the
XF-551.

=3D=3D> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.4) How can I use an IBM-PC as a storage device for my Ata=
ri?

Original by Dave Paterson, mailto:d.paterson2@genie.geis.com

SIO2PC is a cable and software combination that lets you use your PC =
as up
to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes=
up to
16 megs. SIO2PC also lets you redirect the printer output to your PC
printer or to a file on the PC. High speed drives are emulated (a la=
US
Doubler).

All these functions are transparent at the Atari end; you never notic=
e the
difference between SIO2PC and regular drives, except that the SIO2PC =
drives
are faster than any others (except Ramdisks and PBI interface drives)=
.

SIO2PC 3.19i is shareware by Nick Kennedy.
Merit/UMich: Sio2pc/sio319i.exe

Of importance to SIO2PC users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files i=
nto
SIO2PC .ATR's for use with SIO2PC and PC Xformer.
Merit/UMich: Sio2pc/dcm2dsk2.zip

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8=
-bit Atari
users should treat themselves to either MYDOS or SpartaDOS to appreci=
ate the
power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but=
provides
subdirectory and hard-drive support. SpartaDOS is a completely diffe=
rent
command-line DOS modelled after MS-DOS, though it is perfectly capabl=
e of
reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g is disk-based;
SpartaDOS X 4.21 is cartridge-based and includes many additional feat=
ures.
SpartaDOS is available from Fine Tooned Engineering (see companion ve=
ndor/
developer list); MYDOS 4.53/4 is freeware from Wordmark Systems (Char=
les
Marslett and Bob Puff).
It is recommended that all 8-bit Atari users own at least DOS 2.=
5 for
complete compatibility with existing software, and then choose either=
SpartaDOS
or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all avail=
able on
the archives.
Merit/UMich: Os/dos25.arc (DOS 2.5)
Merit/UMich: Fte/fte32g.arc (SpartaDOS 3.2)
Merit/UMich: Os/mydos453.dcm (MYDOS - latest version)

Subject: 13.3) What are the power-supply requirements for my Atari
components?

As with the rest of this FAQ list, please let me know if any of this
information conflicts with the units you have. I'm also not sure how=
much
of this section is valid outside North America. If it's not valid wh=
ere
you are, I need to hear from you!

The most important information is the voltage (in volts) required, an=
d
whether you need a transformer (AC output) or an adapter (DC output).=
The
power (in watts) and current (in amperes) specifications of the origi=
nal
equipment as presented here should be regarded as minimum values.
Higher-than-specified power and current capacities are entirely usabl=
e,
and often preferable because such supplies run cooler and last longer=
.

Relevant law of physics:
Power (in watts) =3D current (in amps) * voltage (in volts)

Subject: 13.5) What BBS software can be used on the Atari?

This section by mailto:winston@merk.com (Winston Smith)

Here is the run down of ATARI 6502 8-BIT BBSes that I am aware of:

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Comp=
uter
Enthusiasts computer club (was it the Michigan chapter?). It include=
d
designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoR=
eM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was progra=
mmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas wer=
e
added the name was extended to FoReM 26M. Then, When OSS released BA=

SIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote =
most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sporte=
d
features such as intra-line editors. Unfortunately, the coding of th=
e
ABBCS was really poor. You could practically blow on your keyboard a=
nd
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS =
was
the first to support a RAMdisk, which Paul Swanson called a "V:" devi=
ce
for "virtual disk". This BBS was written in Atari BASIC and required=
a
joystick hardware "dongle" device. This was notable as being one of =
the
first Atari 8-BIT BBSes that could actually go for a week without hav=
ing
to be rebooted. Pointers to the message base were kept in an Atari "=
very
long string" (for which Atari BASIC is famous). The BBS would only h=
ave
problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the us=
e of
the commercial BASIC XE cartridge to run. This BBS program was very
popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC.=
It
expects to be running under a SpartaDOS environment. This was a prob=
lem
until very recently, when the disk-based version of SpartaDOS was
re-released as shareware. This BBS program uses a "modem clock string=
"
rather than an R-Time 8 cartridge in order to retrieve the current ti=
me.
It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BA=
SIC XE
cartridge in order to run. It is in the public domain and can import=
and
export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only,
control ATASCII graphics are reserved for message data-structure byte=
s).
FOREM-XE BBS is still currently in use as we speak, and may be reache=
d via
the PRO! EXPRESS-NET as long as the cross-networking "transnet" is st=
ill in
effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS=
!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM
terminal program of days gone by. I am not familiar with this progra=
m. I
think that it is written in Action! and only supports XMODEM Checksum
transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUA=
GE--
demo version of the OASIS BBS program. OASIS is very crash-resistant=
and
comes with a "dial out" screen so that the Sysop can use the BBS as a
terminal program to call and fetch files without having to bring the =
BBS
down and reload a terminal program. OASIS supports "Door programs" w=
hich
it refers to as "OASIS PAL modules". This OASIS demo module comes wi=
th an
excellent message system. The OASIS file system is one of the most
complicated that I have ever seen. It consists of "file libraries" w=
ith
suites of "file types". There is quite a bit of overhead involved in
performing a download (which may be a good thing, as it discourages f=
ile
hogs). There is a commercial version of OASIS called "OASIS IV" that
performs networking. There was an OASIS network between Boston,
Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionall=
y word
of the OASIS IV developers reaches the network from New Zealand or Ca=
nada.

o Frank Walters BBS -- I know nothing about this BBS except that F=
rank
Walters wrote it.

OASIS IV, CARINA, and BBS-EXPRESS-PROFESSIONAL! are all commerci=
al
programs. I haven't heard anything about OASIS IV and CARINA for a w=
hile,
but PRO!-BBS is still a viable commercial enterprise last that I had =
heard.

It reports 280rpm. That is why some commercial programs refuse to load from the drive. Part of the copy protection is looking for 280 & it sees 300, assumes a modified drive & stops.

The mech -is- a Mitsumi which is very standard and easy to find. Just one of the many reasons the XF551 is a good drive to have around in spite of the documented bugs and cheap construction.

>If I boot my real drive with DOS-XE, I cannot copy files onto a non-DOSXE
>disk; and if I boot up with MYDOS45.ATR on my 'image drive' i can't seem
>to read my DOS XE DISKS....

You can not read DOS-XE disks with anything but DOS-XE! You should boot with DOS-XE and transfer -everything- you have to the standard DOS-2 format. Once you have done this, you can begin to transfer your stuff with MyDOS via the SIO2PC system. DOS-XE is one of those dreaded non-compatible DOSes for the Atari... It and DOS-3 should -never- be used seriously if you ever want to trade or transfer files with others. The current preferred choices for DOS are MyDOS 4.5 and SpartaDOS 3.2x, both of which support DD and the DS XF551 drive.

841. Question: Cartridge compatibility

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-01 00:00:00 UTC
From: wardshrake@aol.com
Message-ID: <3t3qph$do3@newsbf02.news.aol.com>
Source record: 90363

This is going to be a stupid question, I'm sure, to those of you who've long played with Atari 8bits. However, after reading the FAQ, etc, I still wonder... My most-familiar computer system is the Commodore 8bits, but nothing (well, very little) ever worked from system to system, with their stuff. Hence the question:

Can any old 8bit cartridge be played in any old 8bit machine? Or more specifically, if I came across some old Atari 800 cartridge games that I liked, could I play them on the Atari 600XL someone just gave me?

Thanks in advance for the help!

Ward Shrake

>question though from what you said. Do DOS and Basic run concurrently?
>Or do you have to go from one into the other?

(I'm assuming I'm the Gary you're talking about.)

Ummmm.....let's see, I guess there's a simple answer and a more complex one.

Simple answer: No, DOS and Basic do not run concurrently. You must go from one to the other. Except in special souped-up systems 8-bit machines can only run one program at a time, and DOS is simply a machine language program.

More complex: Of course, the Basic language is a ROM (either literally a game cartidge on 400/800/1200XLs or an internal chip for XL/XEs other than the 1200XL), and therefore when enabled its code is always present in memory. However, any LOADed Basic program is in RAM. When you go to DOS, it wants (at least some of) that RAM for itself. So, in Atari DOS 2.0 and 2.5, you lose any Basic program currently loaded when you enter DOS (type the "DOS" command). When you exit DOS (menu item "B"), you will return to the Basic "READY" prompt, but no program will be there. EXCEPT, there is a way to avoid this by enabling the MEM.SAV funcion of DOS (CREATE MEM.SAV, I forget the menu letter). This creates a swap file called MEM.SAV on your disk to which the affected RAM is copied before DOS is entered and from which it is retrieved upon exiting. This is a very slow process if MEM.SAV is on a floppy, or a very fast one if you have a 130XE or other machine where DOS 2.5 can put MEM.SAV on a ramdisk. Other than wanting to use fancier disk drives than vanilla 810s and 1050s, this is probably one of the main reasons more advanced users tend to switch to other DOSes--most every other DOS (SpartaDOS, etc.) load the DOS program elsewhere, so it doesn't conflict with Basic.

Technical note: Strictly speaking I was fudging a bit when I said 8-bits only run one program at a time. It is possible to create small machine language routines that run in the background along with the built-in OS background functions such as maintaining the screen image, handling keystrokes, making sounds, etc. This is how background music and cursor movement is done while other things are happening. This is all invisible to the average user.

Gary Holder

I believe there were one or two cartridges that did not work with the XL/XE
systems. Also, any cartridge that used all four joystick ports will be
limited to the first two. 99.9% of carts will work with any Atari 8-bit
system.

I had a program that was in a magazine in about 1981-82 that I cannot find. The name of it was Player-Missile Graphics Editor. I found it very easy for creating players in different modes. I do not know the name of the magazine. It was not Antic or Analog or Softside, but it was a general computing mag, with listings for several computers. The original listing was buggy and didn't work right, but after debugging it, it was great. If anyone has this program, please respond.

From: lucius@astro.ocis.temple.edu
Message-ID: <3t4g1j$t8k@cronkite.ocis.temple.edu>
Source record: 90373

How much interest is there in making a SIO to Macintosh application, like the SIO2PC program? I have a Mac and I built an adapter cable between the Mac and the Atari, but there was no software so I wrote something for it. It's not very polished right now, but if there is enough interest, I could fix it up and upload it.

Hello All Atarians,

I am interested in getting info on where I can find an Atari SX212 modem compatible terminal software to do file transfers via phone or null modem to my PC. I have some data/text files I would like to transfer. I have all necessary hardware, but no software. Thanks in advance to all who choose to help.

I'm interested in this, but I've also often wondered why no one
has done an SIO2ST!!! It would seem to have at least as much appeal as
SIO2PC or SIO2MAC. I asked Nick Kennedy about porting his software when
I registered it, but he said that it was written in assembler and also
went directly to the PC serial port so it could not easily be converted.

I have a friend who uses SIO2CPM and he was going to try to use
it on his ST by running the CPM emulator!

For the most part, yes. I can think of two exceptions:

(1) The are a few cartridges that won't run on the XL or XE machines,
most likely because they rely on an undocumented quirk in the original
400/800 operating system. Deluxe Invaders comes to mind. These should
be few and far between.

(2) Many of the later cartridges released around the time of the XE game
system need more than 16K of RAM, so they won't run on a stock 400 or
600XL. Some of these cartridges even require the extra 16K found in the
800XL and later computers, but not in the 800.

Here's something I have yet to hear about this PAL modification: How does it affect NTSC software? I would expect games to run slower; I'm not sure there are any other differences. Is there some NTSC software that relies on precise timing? (Hmmm...will VBI driven NTSC music sound off on PAL systems?)

>anything?

It just refuses to do anything, at worst. The smoke stays safely
inside the chips. You might get weird things on the screen.

Any incompatibilities only show up when the game tries to run. All
the pins are the same on all the machines, so there's no chance of
shorting something out or anything like that.

And again, you may never run into an incompatible cartridge.

870. FS or Trade: two 9-pin printers

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-02 00:00:00 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <RA-dvG7.lmcclure@delphi.com>
Source record: 90392

Here is what I am offering to trade or sell :

Printer Model	Approx. Cash Value
Panasonic 1091i	$70
Star NX-1000 Rainbow (color)	$75

Both printers are in very good condition, and include original manuals
and boxes (although the Star's box is missing the styrofoam packing blocks).

ITEMS WANTED IN TRADE:

* CSS Ultraspeed+ OS + <$12 cash
* CSS XF single (3.5" drive) upgrade (including 3.5" mech) for my XF551
* FTe Sweet 16
* Transkey
* Newell or ICD RAMbo upgrade with RAM + <$30 cash (<$40 if no RAM)
* 3.5" 1" high SCSI drive of equivalent value
* External 14.4Kbps data/fax modem
* Set of four 1meg SIMMs, 120ns or faster
* Set of two 1meg 2-chip or 3-chip SIMMs, 70ns or faster + <$15

If you have something not listed that you think I might be interested
in, make the offer...the worst I can say is "No thanks".

If you have an item you want to trade but think it is worth more than
the printer you want to trade it for (i.e., a Quantum LPS240S)
for the let me know how much extra you would want from me.

If anyone wants to trade for both printers together, I will also
consider offers for trades for more expensive gear (i.e., a Black Box).

BONUS: If anyone lives in the Little Rock area, and wants to make the
trade, I'll throw in a sizeable box of fanfold paper I never got
around to using.

Hi kids.

In a recent AR message, it was mentioned that you could type control-FIAT as the character's name, then enter a special code phrase (that was provided too, but the odd mantra has eluded me at this moment) and you could control the speed of the "wheel" that generates the numbers (bob barker, eat your heart out).

B U T (and this is a big one)

It doesn't mention whatsoever HOW to control wheel. I tried key presses, key-punches, and a mix of psychokenetic tid-bits; but that just stops the wheel and merrily sends me through the gate with random stats that resemble miss hathaway for the old beverly hillbillies show. Is there some secret here? Is there a riddle I must answer? Is there no riddle that i musn't answer?

Please reply. I'm waiting and i have no air-conditioner.

thanks in advance.
BOB Z.

You can't hurt the Atari by plugging in a cartridge, unless you do it with
the power on. (And probably not then either). Most likely the screen
will just lock up, maybe the sound will get stuck on one note, or you'll
see garbage on the screen. You are much more likely to run into
problems with disk-based software. There were more programs that
used more than the 16K you have. There are translators that can be used
on XL/XE computers with 64K or more of ram to emulate the older 400/800
operating system. It is also possible to upgrade your 600XL to 64K or more.

873. Atari 8-bit HW $5 + Shipping

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-02 00:00:00 UTC
From: jml10@cornell.edu
Message-ID: <jml10-0207951456320001@cu-dialup-0829.cit.cornell.edu>
Source record: 90395
Cross-posted to: comp.sys.atari.8bit,cornell.marketplace

I have some Atari 8-bit hardware items that I'd like to try to get out of
my closet. I note the condition of each item below: some will only be
usable for parts, but if nobody wants them they get thrown out.

Items 1-2 below are $5 plus shipping costs: item #3 is free, you pay shipping.
I'd like to sell them locally (Ithaca, NY area) to avoid having to ship,
so local offers will take precedence, but if no local offers arrive in
a reasonable period of time the first person who contacted me gets the item.

1) Atari 1025 Dot-matrix printer: Works fine.

2) 10 Meg SCSI Hard Drive: Worked last time I used it, about a year ago.
Takes a LONG time to warm up but works fine once it does. Comes in a PC
case that includes a power supply with an Atari 8-bit power adapter. (The
guy I bought it from says the adapter works fine but I never had the
courage to try it). You will need an external adapter such as ICD's MIO
or CSS's Black Box to use the hard drive. (Sorry, I'm not getting rid
of my MIO yet.)

3) Atari 1027 Printer: Mechanism works, but prints garbage instead of the
desired characters. Probably usable for parts.

Yes, I did post this sale a couple months ago: I can't get in touch with
the guy who wanted items 1-2, so I'm putting things up on the open market
again.

Email me as jml10@cornell.edu if you're interested.

James Lebak
jml10@cornell.edu

875. Connecting an ATARI XE

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-02 00:00:00 UTC
From: Marc.Mueller@irata.Jena.Thur.De
Message-ID: <5p41FvuxFHB@irata.Jena.Thur.De>
Source record: 90397

Hi there,

I have a great problem:

I've bought the "PC XFormer 3.0", a ATARI-8-BIT-Emulator for MSDOS-PC. It works with virtual disks, but producing them is not as easy as it looks (for me).

The package includes the following programs :

* SIOCOPY by Michael Munoz (Allows you to connect an ATARI-Disk-Station to the PC and copy the whole disk into one file) --> doesn't work

* SIO2PC by Nick Kennedy (Tranfers whole disks from an ATARI to a PC, needs a special interface, what I haven't built yet)

* ATARIDSK (??) (reads an ATARI disk using the PC 5,25-drive) ---> works only with 180KB-disks, I haven't such one

Now here the question : Is there any easy possibility to convert ATARI-disks into PC-Files ?

The best possibility would be a cable & PC-Software, which allows to use the PC as a gigantic ATARI-Disk-Drive. (These would be possible with the SIOCOPY-Cable, but I must know, how the ATARI adresses its drive(s), and how its reads/writes).

I hope, my English and my problem were understandable, and anyone can help me.

Hopefully,

Marc

He wrote QBall for the ST, a 3-D pool game where you try to knock the
balls into the corners of a cube. I guess that's what his idea turned into.

Your English is fine. Do you absolutely need full disk images transfered?
If you can take it a couple of files arc'ed together at a time & have
FTP access you could always try Mule the transfer program. It will work
with a stock 1050. Other then that, if you have a modem on the Atari or
a serial port you could always null modem it over or transfer it via a
bbs. Mule is at archive.umich.edu in the Atari 8 bit section, but you still
need to down load the 8 bit part to your Atari. I'd really recommend building
the SIO2PC cable anyway, it's a great toy to have around.

From: rford10445@aol.com
Message-ID: <3t8lo3$gl5@newsbf02.news.aol.com>
Source record: 90306

I haven't been able to get RiverRaid to work with Xformer.....but maybe
it's because I have Xformer 3.0 not 3.0a which fixes a player-missile bug.

Spy vs. Spy works fine......

Currently, I have a bunch of disk images consisting of only software that
works with xformer.....if you want to trade or something, let me know.

881. XEGS Schematics for Video Upgrade?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-03 00:00:00 UTC
From: tdrake1@umbc.edu
Message-ID: <3t7jg7$81l@news.umbc.edu>
Source record: 90307

Anybody out there know where one can locate the schematics for the XEGS?

I am trying to locate the luma/chroma signals if they are available so I can have the equivalent video to my 130XE instead of the defaulted composite video signal only. The regular video out is not all that bad but there is no luma for good 80 column viewing.

Has anybody successfully "upgraded" the video on the XEGS??

Thanks!

Tom

> Thanks!

Genesis controllers work perfectly with teh 8-bit. You just have to gte
used to only pressing the "B" button al the time, because the "A" and "C"
buttons don't work on the 8-bit. I don't think the "START" button will
work either.

> SIOCOPY-Cable, but I must know, how the ATARI adresses its drive(s), and
> how its reads/writes).

I have two words for the SIO2PC... FORGET IT! I have a much less
frustrating method of transferring and converting Atari disk images, and
it actually involves using both computers. Here it is in 9 easy steps...

Hardware you'll need...

-a 'null' modem
-standard RS-232 cable that fits the ports on the PC and the P:R:
-a P:R: Connection or MIO
-one Atari computer
-one PC

Software you'll need

-Telix with the QDHost Script
-the latest ver. of BobTerm
-DiskComm
-dcmtodsk

Instructions...

1. You'll need to make a null cable to connect the PC and Atari through
the serial ports, through any free port on your PC and R1: of the P:R: or
the serial/modem port of the MIO

2. DiskComm the files that you are sending to your PC

3. Boot up BobTerm

4. Load Telix and the QDHost script. Config the script for a 'Direct'
connection.

5. Set the ports at both ends for at least 9600bps 8N1, TTY/ASCII
(9600bps is the highest for the P:R:, 19.2K for the MIO)

6. On the Atari end, there should be some sort of a login prompt being
sent from QDHost. Enter any old name you wish and the password you put in
the config file for QDHost.

7. send the DiskComm'd files to your PC via the 'upload' option in QDhost

8. when you are done, exit Telix and use dcmtodsk.exe to create an SIO2PC
image from the DiskComm files you transferred.

9. You know the rest :)

10. There is no 10!! HA!

If you need any of this software, you can either download it from any local BBS, or any FTP sitess, or I can send UUencoded copies of it. I use this method a lot, and it works pretty well, and very fast. It's also much more convenient than having to connect my two 2400bps modems together with standard phone cables and transferring that way (slow and painful, not recommended).

Hmm.. which driver did he use for BobTerm? He should use the same type of
driver for AnsiTerm. I definately don't recommend using AnsiTerm for
anything above 1200 baud, though. I'd use FlickerTerm or ICE-Term.
AnsiTerm is much too slow to handle anything past 1200bps. And, before you
delete AnsiTerm, keep the drivers. They work on lots of other programs.

No riddle. I believe it was controlled (faster and/or slower) with the
option/select/start(not sure which), also it may be the one option that
was broke(or I had it set too subtle). You must type the right key
phrase, i am not sure if "cela saute aux yeux" set the toggle speed or
gives one immorttality. Finally the scrolling stats go FASTER the longer
you wait (You might say it's an incentive to avoid procrastination:)

Hi Freax!

This is especially for the Sweet16 developers.
Can anyone say me something about the Sweet16's memorymapping?
This time i'm working also on a 65C816 extension called HyperSpeed XL/XE and
i'll try to set HyperSpeed's memorymap compatible to Sweet16's.
HyperSpeed will contain up to 1MB S-RAM and up to 1MB ROM on board and i must
know were i can place these memories in best case in the 24 Bit addressrange.
Thanx in advance

Mario

```

I don't use these utilities much. Hardly peek at them. I guess I got disappointed when I saw one of these files years ago. (btw I got your Bros2 demo running on a Sparta Disk (have to use it with PabQWK. But I HATE it). I was a bit disappointed.

Man, I wished there was an 80 columns 256 (or more) color upgrade for the classic Atari. When I want to view a GIF picture, I want to see atleast some detail. Especially if it's an X-rated picture. :-)

BTW some time ago, I sent you a message I never got an answer to (I might have missed it, my provider is sometimes hard to reach). Here's the "essence"

You told us you had read in Mapping... that the classic ATARI could use sectors up to 65536 bytes long. The BlackBox uses 512 byte sectors which it splits up, before DOS can get them. Wouldn't it be nice, if we had a MyDOS version that could handle 512 byte sectors? And user-select the "split 512 byte sectors into 256 byte sectors" feature. That way, we could have 32 MegaByte partitions.

Now how's a programmer and absolutely LOVES MyDOS?!?!?! :-)

Sorry Bill, T-34 is commercial. It might have great graphics, but game play is rather slow. You have to change somethigs (gun elevation, tank position) then you see a granate moving slowly across the screen. I guess I payed about US$ 7.50 at ANG software (see FAQ). Most of the Polish software they sell has the text translated into English, don't seem to remember if T-34 is also translated, I guess so.

b >
b >- Darek

I guess you're talking about the Impossible, by CSS (see FAQ).
It started as a hardware mod, but there is a disk only version available.
It checks out, what the computer wants to find (bad sectors, phantom sectors,
double sectors, etc.) and then somehow simulates that.

The software version might even work on emulators.

a >format the disk on the PC....
a >--
a >Ken Arromdee (email: arromdee@jyusenkyou.cs.jhu.edu)

Howdy Ken

I've shared disks between my classic ATARI system (via a BlackBox &
FloppyBoard) and my Dad's XT.

Disks that would be formatted OK on the Atari, could not been read on the
XT. When I tried to format these same disks on the XT, I had to format them
over and over again (Fuji disks). Most of the times the bad sector count
started at 30,000 and went down afterward. Unfortunately, getting it down to
zero was as easy as pushing an elephant. Often the bad sector count would
start to go up again.

If you want to use them on a PC, format them on a PC. Don't use floppies
that are already formatted on the ATARI (either Atari or IBM/ST format).

Just to let anyone know who hasn't made the connection yet but Atari,
Inc. (not Corp those stingy bastages! :-) were developing something
akin to this for the 2600! Yes, that's right. Everyone dig out your
2600 catalogs and look for the "MindLink" device. It looked like a
sweatband with some tumors on it. You put this on your head and
attempted to control game play with your alpha waves. It was never
relaesed but I hear tell there are prototypes and some proto ROM games
for it floating about. If someone knows more about this I wouldn't
mind reading!

Okay, it is now driving me buggy having to set the time/date at boot.
Anyone want to let one fo these go?

I would pay some cash or offer a couple of pieces of 8-bit hardware in
exchange!

Also, I am still looking for a Diamond GOS cart. I have one nibble but
am still looking! Thanks!

ACK! WHY OH WHY did I sell all of this stuff!?

The program you seek is SIO2PC, which you have. You need a cable, which I'm sure you have the instructions to build - or you can ask if anyone has one to sell or can build one for you.

If you're confused (or just in case I am), it requires:

an Atari
a PC
an Atari disk drive (optional)

What you seem to want to do is transfer files from the Atari onto the PC to use them with PC Xformer (although, I kind of wonder why you want to run Xformer since you already have an XE - or do you???).

Anyway, what you'll be able to do is copy un-copy-protected software from the Atari disk drive to the PC using the Atari. (I believe a smart cable and some software which lets you connect an Atari drive to a PC is in the works, but for now, this is the best you can do - and it's easy.. It's just like copying files from one disk to another! :))

Anyway, I hope I helped some! Good luck! SIO2PC is a GREAT thing!)

>that are already formatted on the ATARI (either Atari or IBM/ST format).

I've gotten two similar answers, and I'm not sure I've asked the right
question.

I want to use (MY)UTIL to transfer programs from a PC to the Atari 8-bit,
because it is much easier for me to download materials onto the PCs here,
than to download onto the Atari at home (in fact, the Atari's disk drive is
just flaky enough that I can't download at all; there's a small chance
each time the motor tries to start up that it won't, and at 1200 baud
downloading ends up starting and stopping the motor for every sector).

My experience is that formatting on the PC results in the disk being difficult
to read on the Atari. Formatting on the Atari and using UTIL on the PC to
copy to the formatted disk, results in about half the copied files being
unreadable.

Overall, I get better results formatting on the Atari. But neither one works
very well. (And to top it off, these are old disks that may have some bad
sectors regardless, and I was not using the newest version of UTIL.)

What should I do?

Source record: 90402

Hi There,

I'm trying so hard to set a friend up with an 80 column terminal program for the Atari 8 bit. I've got a program called AnsiTerm, which claims it runs in 80 column mode. Unfortunately, we've tried all the drivers that come with the program, but none of them work. He's got a 'home-built' interface for his modem and it works fine in BobTerm.

Has anyone successfully set this program up? If so, how?! If not, can anyone reccommend a better terminal program. It needs to be able to emulate ANSI and preferably have 80 columns.

Thanks a lot,

;>If I remember right, the asm/ed cart was designed to not be able to copy the
;>rom correctly. MAC65 might do it, though I haven't tried it.

;Doesn't matter if MAC65 does it or not, because you won't get a full ROM
;image if you do it this way. You should write a small program that writes
;the $C000-$CFFF ROM region to a file, then clears bit 7 of $D301 and write
;$5000-$57FF and finally write $D800-$FFFF. This will produce a file of
;exactly 16KB.

That's for 800XL, Ivo!

For the 800 rom, surely a simple BASIC program would be enough. i.e. open
a file for output, write out the 10K ROM and then close it.

Here's the following for sale - US$700 o.b.o.:

* Atari 1040ST, dual drive system (one internal, one external), mouse and
all necessary cabling.

* Color monitor (SC 1224).

* Spectre GCR emulator cartridge. It gives a basic Mac Plus equivalent and
reads/writes to Mac formatted disks. (I'll include Mac software for word
processing if interested).

* IMG Scanner (cartridge based scanner to work in conjunction with the printer).

* Yamaha PSS 680 MIDI keyboard (with cables to attach for use with Music
Studio)

* Star NX-1000 dot matrix printer (with all my unused ribbon cartridges)

* I'll include my whole library of Atari ST disks (all my software collected
over the years).

FINE PRINT:
It is in great condition and I'd like to sell it as a complete whole if
possible. I'm in the New York City area and will consider selling outside
NYC if you're willing to pay for shipping. Price is negotiable...
Please e-mail directly.

Regards,
K.K.

Ouch! Well, can't please everyone:). Just remember the time frame (Space Invaders, Caverns Of Mars, etc.). Personally I liked it of course I am prejudice in the extreme. But if you do not like scrolling shoot-em ups, or if you only want a fixed ending game, then it wouldn't be one's cup of tea.

One of the strange side of effects of playing Tail of Beta Lyrae is that after playing for a while if you look at a wall or drape, the wall seems to undulate (No psychotropic drugs required:). Don't worry the effect wears off.

As an interesting note, when PC Xformer became available, I started working on a PC based program that uses a parallel cable connected to an Atari disk drive (without the use of wacky-assed inverters and other crap -- a straight rewiring of the Atari molex to a 25-pin hood!) It is conceptually similar to the way the ST Xformer cable works. Unfortunately, I got the program barely working enough to move a handful of my disk images into Xformer files -- It'll do a single density floppy from a 1050 in about 2 minutes.

The project is on the back burner in favor of other (money making) projects. However, if there is enough interest, I'll be happy to complete the software and specify the cable pinouts as soon as I get some free time.

Well, people seem to dislike Bros.2, so, although I'll finish it eventually, I've become discouraged enough to drop it for now.

But- I've started working on a Unix RPG which will interface to other programs - a terminal on the PC (I need it to test the thing since I STILL don't have modem access on my poor Atari!) and maybe a pseudo terminal program in Unix (using popen() in C to read from / write to the game engine).

The reason I'm using a Unix box is it's SO incredibly fast - all the PC/Atari/ etc. is used for is final display and controls.

The game will be a bit like Ultima, when it comes to graphics (overhead view, 20x10 cells). The reason I need the speed is per frame, I need to calculate TONS of things- not just about you, but about your surroundings, all of the other objects, etc. I mean, this game will even have flowing water- you place an object in it and if it doesn't sink, it'll move along with the water! :)

It'll need a Unix box, an Atari or PC with a modem (9600 or above else the frame rate w i l l g e t r e a l l y S L O W !!!).

As for the graphics.. well, with all of the space I'll have by not having any real CODE in the Atari, I could probably have a LOT of detailed animation (8 frames) and I can probably use a multiple DLI to give 64 different objects, even in 160x192x4 color or 320x192x2 detail!

---------------PART-2-------------

I'm also working on Simple Shanghai for the Atari, as well! :) I've got the menuing and mouse system working. I'm gonna forget it when it comes to very complex tile layouts- my drawing routine isn't good enough. I guess I SHOULD have stuck with a bitmapped mode instead of convincing text mode that it was good enough. :)

So far, though, it should be pretty good.. up there (maybe above? :)) Bruce Fish's My Jong. (160x96 graphics can be pretty pathetic at times :( )

Quoting kendrick@zippy.sonoma.edu

k >Marlin - Diamond GOS isn't worth it, In My (and many others') Opinion

Not completely true, while it is limited by lack of memory and processor speed it's main problem came from the fact that there was no one other than it's original author who wrote programs for it. Oddly I've used the paint program several times in 93 for things we did leading up the summer school. I've go ver 2.0...one of the kids decided they needed my ver 3.0 more than I did so I'm down to just 2 ver 2 carts. Ah well such is life.

I have heard that the only change in the Nir mod to the OS involves (I
believe) $d014, the byte that tells the computer if it is NTSC or PAL (
bits 1-3=0 is a PAL machine). Could it be this simple?

I recently got out my old Atari 800XL, and 130XE, and I was playing most
all the games, and I wondered if anyone knows of a cheat/hints/tips/etc.
file for all the games that where made!?

For example, I have Bounty Bob Strikes Back, (cartridge) and I only know
2 of the special codes (#100 & 1000) and I only remembered 1 hidden message
about some teleport to level 7. Anyone know codes/messages for this game!?

Or how about Alternate Reality, that was one tough game, and whoever did the
conversion to the Amiga blew it, because it was really horrid! Anyway,
any cheats for this?

How about Realm of Impossiblity!?
And about 50 other good old games?! :)

Also, anyone know how/if you can hook up a 800XL or 130XE to a Amiga? I looked
in the FAQ, and I did not find it. :(

Thanks for any info!!

>
Sorry, I'm not bored enough to type them all out (you might check the FAQ, though, there's a lot of tech info in there). But #139 rang a bell as being a potentially bad one, so I pulled out my manual...

It's "Device NAK: Device not acknowleged; garbage at serial port or bad disk drive".

Hope it's not as bad as all that, I believe it may also occur if you're trying to access a drive
not in system and perhaps if you're trying to access an incompatible disk. Perhaps also after certain types of semi-lockup or when looking at certain types of trashed disks.

Hmmm....but if memory serves, it happens a lot when you've got a flakey serial cable or a dirty set of pins in an SIO port. Try other cables if you've got 'em, and/or try cleaning the
pins. If your system has been in the closet a while, those contacts could well have corroded a bit. The quick and dirty way is to firmly grab the SIO cable connector and vigorously (but carefully!--don't want to bend a pin!) excersize the connector in and out a dozen or so times. It may also be dirty contacts in the cable, which this technique also helps. I once had a drive which must have had weak SIO interface signals--it had this problem a lot, and I sometimes had to forge a little cleaning device out of a piece of thick paperclip roughened up with wire cutters which I worked in an out of each hole in the SIO cable. You might also try working your drive number switches back and forth a few times.

I may be wrong, but I had the impression that an 8-bit version of this WAS
released--at least it was VERY close to it. I remember seeing Atari
magazine articles and pictures. Perhaps part of the AtariLab series?

Are you sure it was controlled by Alpha waves? I had thought that it
worked with forehead muscle tension detection (this is all very long ago).
Back in those days EEG biofeedback was my field, and it seems like I
would remember more about it. It's much more difficult to pick up EEG
signals in a small (and cheap!) device than muscle activity (EMG).
Especially then; its been done since pretty cheap.

Hi everybody!

I have also gotten the program '800XLDJ' but I can't get it
working on my STe. Does anyone else also has this kind of
problems?? Maybe it's the TOS-version or something?
When I start the program, it seems to create the folder 'CLIPBRD'
and then the 800XLDJ-window comes up, with 8 disk-icons in it and
the computer 'hangs', I can't move the mouse, nothing....
My STe is, I believe, one of the newer ST-machines Atari made.
It has a memory test when you cold-boot the computer, for
me that's the only noticeable difference. I just bought
the computer, therefore I do not know much about it...

It would be depressing to see it eaten alive in today's PC game market,
though. New games are hyped-up, released, and off the shelves and
impossible to find after two months. Modern sequels to great classics,
like Archon Ultra and Frontier, sure didn't last long.

You could try the program called "ULTRAFIX". ULTRAFIX comes in two
varieties, an ULTRAFIX.AOS for ATARI OS version A (the OS in the original
ATARI 800) and ULTRAFIX.BOS for ATARI OS version B (which fixes some SIO
"pause" bugs and other things). You might have luck with this OS
"translator".

esmith@netaxs.com (Edward M. Smith) wrote:

ES> Trying to find out what the main difference if any between Mydos 4.3
ES> and 4.5 and would it be worth while to use 4.5.

First of all, there is no MyDOS 4.3 ! The two versions in question
are MyDOS 4.50 (a.k.a. MyDOS 4.54) and MyDOS 4.53. MyDOS 4.50 uses 4-byte
file sector numbers and can be used with large hard drives. MyDOS 4.53
uses 3-byte file sector numbers so as to be compatible with ATARI BASIC
NOTE and POINT functions that expect 3-byte file sector numbers on a floppy
disk. It is needed mainly if you are doing random file access and are
using ATARI BASIC and do not wish to write source code to handle 3-byte and
4-byte file sector numbers. A further difference is that some versions of
MyDOS 4.53 have been patched to allow for leading numeric digits to be used
in a filename (it is considered illegal to use a leading digit in a filename
under MyDOS, although ATARI DOS allows this). If you aren't using ATARI
BASIC NOTE-and-POINT, then the differences do not matter. If you are using
ATARI BASIC NOTE-and-POINT and know enough to query up to four digits for a
sector number, then it shouldn't matter. If you are using a compiled BASIC
program that performs NOTE-and-POINT, then it --COULD-- matter, except that
compiled programs are usually boot disks that include their own DOS on the
disk, so it usually isn't a problem. You simply need to be aware that MyDOS
4.50 uses 4-byte file sector numbers in place of the standard 3-byte sector
links.

I've run a bunch of stuff through the Nir-PAL upgrade, and haven't noticed much of a problem. The repeat key speed is slower, and the CTRL-3 bell sound is a little lower in frequency, but none of the games or music I've tried are noticeably slower. Do you have something in mind that relies on VBI timing? I'll try it if I have it.

It might be that byte plus the one that describes the keyboard repeat rate.
Apparently some European demos check one or the other of these and adjust
the display list or something else. I haven't seen much of a problem though.

948. WANTED: R-Time 8 cart opr equivalent

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-05 00:00:00 UTC
From: REASERRL@m120x1.laafb.af.mil
Message-ID: <2FFB079F@M130X2.LAAFB.AF.MIL>
Source record: 90270

According to the latest issue of Atari Classics (which I got last week), CSS is selling R-Time 8's. I'd check with them and just buy a new one. Also, Mike Hohman of FTe announced SDX 4.22 on GEnie yesterday (4th of July). The upgrade for current SDXers is pretty reasonable. The new SDX supports MUX and SIO2PC.

From: REASERRL@m120x1.laafb.af.mil
Message-ID: <2FFB07B2@M130X2.LAAFB.AF.MIL>
Source record: 90271

Toad Computers had the "original" Atari 8-bit Bio-Feedback device, programs and book package in their store about a year ago. It looked like an interesting package. It appeared to be a "sweat-meter" that you taped to your hands and then plugged into the joystick ports. Someone might call Dave or Jennifer Troy to see if they haven't sold it yet.

953. PC XFormer & BIG images

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-05 00:00:00 UTC
From: ejeid@oeonline.oeonline.com
Message-ID: <Pine.3.89.9507052143.A17773-0100000@oeonline.oeonline.com>
Source record: 90275

Greetings all!

Forgive me if this question has been answered more times than you all care to count, but I only recently hooked up here, so I'm a bit behind. :)

According to the PC XFormer manual (p. 6), you can configure a drive to be high capacity with MyDOS. I've tried that, but it ends up giving me less space than a normal double density disk and refuses to write properly anyway.

I'm wondering if the problem is that I don't already have a high capacity disk image to start with. I've created all of my enhanced and double density images simply by copying an existing one outside of the emulator. Is there a blank high capacity disk image floating around at umich somewhere?

How do I get around this? It's amazing how little space double density disks actually had... I'd like to have BIG disks, especially if I'm writing programs.

On a side note, the MyDOS RAMdisk is perpetually 0 sectors small. Yes, I'm running in XE mode. :) Is this a problem with MyDOS or XFormer?

Thanks in advance...

956. Simple Shanghai!

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-05 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3tcmp6$9r@nic-nac.CSU.net>
Source record: 90278

Coming soon! Simple Shanghai.

So far, it's a 100% text based game. ("The top tile is: .. The tile to
the right is: .." Just kidding! It's done with redefined characters!)

It has some nasty limitations, however. Currently it's only in 320x200x2
resolution. It only lets you have 8 tile faces.

The layout is up to 320 tiles (8 across by 8 back by 8 high)
You can look from the right (3D) or from the center (not too great)
You can flip the thing around 180 degrees to see from "behind."

It uses a joystick-or-keyboard-controlled mouse pointer and a pull-down
menuing system.

You can set different options:
Timed or not
Cheat modes
Select a set of tiles (what they look like- internal default is alphabet)
Select a layout (how they are placed- internal default is a pyramid)

Other commands include:
Save/load games in progress
Undo (all the way to the beginning!) - even set an undo-to point
(say you're at a kind of crossroads- pull that peice out and you might
screw it all up eventually, or you might win the game easily from there..
simply select "Set Point".. if you find out you goofed, just select
"Undo to point" and it's as if you hit "Undo" enough times to get right
there)
Hint
Online (via file) instructions

Of course, many of these features are unimplemented. In fact, the GAME itself
hasn't even really been touched yet, but it should prove to be quite simple.

The graphics aren't top-notch, but it's quite fast. In fact, the whole point
of Simple Shanghai is to produce a game even BETTER than Bruce Fish's
excellent "My Jong" (which I love, BTW)..

Anyway, look for it (or beta versions) soon! :)

I have the following Atari 8bit hardware/peripherals for sale or trade:
---------------------------------------------------------------------

3 x Atari 800xl (modified with SuperVideo/Audio and 100% socketed)
$50.00 each or trade(s)

1 x Atari XEGS socketed with 15' keyboard extension cable
$65.00 or trade(s)

1 x Atari 400 with split audio (audio via normal output or via standard
RCA cable
$25.00 or trade(s)

1 x ICD (FTE) PR:C with 2 serial and 1 parallel cable(s)
$50.00 or trade(s)

1 x TRAK AT-D4 double density, slave-able super disk drive
$60.00 or trade(s)

2 x Atari 1025 dot-matrix printers w/extra ribbons
$40.00 each or trade(s)

1 x Atari 65XE (socketed) with supervideo/audio upgrades
$40.00 or trade(s)

1 x 3 slave CSS Multiplexor (complete package with approx. 40' ribbon cable
$160.00 FIRM (no trades)

1 x Atari 810 with HAPPY 7.1 upgrade
$80.00 (no trades)

1 x Atari SX212 (1200 baud) direct connect modem
$35.00 or trade(s)

1 x Atari XEP80 (80 column device)
$65.00 (no trades)

1 x registered node X324 of BBS Express Pro! -- ready to run on
an 80meg MFM hard disk loaded with TONS of 8bit software and Pro! commands
$175.00 (no trades)

All items, unless otherwise noted are in good to great condition.

Just read the faq. Wow, it's cool people are still using Ataris. Of course the 8-bit Atari is the only computer worth calling an Atari. The ST line was a ridiculously conceived joke.

Wow, talking about Antic in the faq. Remember A.N.A.L.O.G.? What was the name of that program to generate Missile Command explosions, written by my then-hero Tom what's his name? Remember coming home from school, firing up the computer and the 410 casette? Remember that football game? (I know, I know, be specific.) Remember the frustrating 1200XL keyboard (different from the other keyboards), or its stupid help key? Remember Alan Alda plugging Atari?

Remember formatting disks? Remember having to boot off the disk drive first, or you wouldn't be able to save anything? I wrote a program once back at computer camp, and lost it because I hadn't booted DOS. Remember ATARI NOTE PAD or whatever it said? Remember START, SELECT and OPTION?

Remember Mapping the Atari? Remember programming in BASIC? I won second prize at the San Diego science fair with a character generater I wrote (CHAR PACKAGE), which (oo, it's all coming back to me) was bought by Analog (I think) for publication, but then it ended up being put on their BBS instead. I also wrote some stupid typing tutor, which was also bought ($75 each). Wow, that was fun.

Remember interrupts? Writing programs to work automatically? Remember when Action! came out, and we all bought our cartridge? Remember pirating software, and breaking games, especially Synapse's games?

Hmmm. Maybe I will pick up a used computer. If anyone has a computer to sell with a LOAD of games (you can flame me for pirating if you like, but it's a moot point now), I would consider it if the price is cheap.

Sorry if I'm running on and on. But this is really natsukashii.
[Japanese for, I'm really awash with memories right now]

Time to clean house, so here are some Atari 8-bit items for sale. (No,
we're not abandoning the 8-bit, just right-sizing!) Sale details noted
with each category. Email questions, offers, etc. Thanks!

Hardware

I'll sell items individually or together in any combination, and all items
go to best offer. Buyer pays shipping.

Item Status Includes
---- ------ --------
Magnavox 14" Color Works fine Atari A/V Cable
Composite Monitor

Generic 14" Color Slightly lighter area Atari A/V Cable
Composite Monitor in center of screen

65XE Computer Bad A-D converter, Power Supply
else fine TV Cable

130XE Computer Flakey expansion port, Power Supply
else fine TV Cable
Manual

1030 Modem unknown nothing

SX212 Modem Works fine Power Supply
SIO Cable
Manual

1010 Cassette Works fine Power Supply
SIO Cable
A few free program tapes

Uprint Parallel Works fine 16K buffer
Printer Interface (text only)

Atari 1025 Works fine SIO Cable
Serial Printer

Midi

Hybrid Arts' Works fine Hardware and MidiTrack II &
MidiMate Midi III software
Interface Manuals

A rather capable, command-driven (ie not graphical) Midi sequencer, given
the limitations of the platform. The MidiTrack II software requires 64K;

Miditrack III requires a 130XE (does bank-switching). $50, which includes shipping.

Software

All w/manuals, most in original boxes.

Educational - $3.00 each plus shipping, minimum order of three, please.

Vocabulary Grammar Biology
Linear Equations Quadratic Equations Fractions: + & -
Fractions: * & / Multiplication Division
Spell-it grade 5 & 6 Science grade 5 & 6 Science grade 7 & 8
US History grade 5+ US Government grade 10+ US Geography grade 5+
World History grade 8+ World Geography grade 8+

Big deal -- $40 for all 17 of them!

Flight Simulator II - $5.00 plus shipping

Books

6502 Assembly Language Programming by Lance A. Leventhal - $5.00

Compute's Second Book of Atari - $3.00

Shipping not included.

971. Re: Sweet16?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-06 00:00:00 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <JUx8fZk.lmcclure@delphi.com>
Source record: 90156

In a message dated 7-27-95, Mike at Fine Tooned said:

"The Sweet 16 is more of a "board" than it is a "card". It
comes with a 65816 processor, and will support linear memory
via the upcoming release of the MARS 8 board."

I have been meaning to ask; how many SIMM sockets will the MARS 8 have
and what size SIMMs will be supported?

In an ideal world, two SIMM sockets, with support for 256K, 1meg or 4meg
SIMMs would be present. My reasoning behind this is because while 256K
SIMMs don't pop up that often, they are usually sold very cheaply when
they do. This would give an easy path to a useable amount of memory
(up to 512K) for those on a budget. At the other end, supporting 4meg
SIMMs with 2 SIMM slots would allow 8 megs of memory for power users.
While many would say, "Ah, no one will ever use more than 4 megs of
memory on an Atari 8-bit", I say to those, "You can never have too much
memory", and "PC...640K".

Back to the 65816 itself, what happens if one is simply plugged in
place of a 6502 (not on the Atari 8-bit, which actually uses a custom
6502, but on a machine that uses a bog standard 6502, like an Apple,
Commodore PET, or VIC-20). I ask this, as I have an spare 65816 sitting
on an spare parts IIgs board, and a VIC-20 in the same room. <grin>

Switching to a different piece of FTe hardware, is the MIO II still
slated to include a bi-directional parallel port?

973. Re: Genesis controllers for 8-bit?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-06 00:00:00 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <JUxcv-t.lmcclure@delphi.com>
Source record: 90158

In a message dated 7-3-95, Chris Brown said:

"Genesis controllers work perfectly with teh 8-bit."

CMD sells a Genesis compatible game pad for Commodore 8-bits (and which would also work on an Atari), that has two of its six fire buttons operational, as opposed to only one. However, the review notes that the unit has been modified, and could damage a standard Sega system if hooked up to one.

I believe their is a file floating around that tells how to make this modification.

Actually, an enterprising hardware hacker could make all six buttons work, simply by rewiring the four unused fire buttons to the directional switches of the joypad, to provide an alternate method of movement. Other choices would be attaching the the unused buttons to the paddle inputs. One could even add inline resistors, so that two buttons could be tied to one input, giving different values for each button. However, this would only be good for custom software.

Another choice would be to add a autofire circuit to one or more buttons, and rewire them into the standard "fire" line.

Hmmm...here's an idea for a nice hardware hack...an outboard "box" that plugs a gamepad plugs into, and then plugs into the Atari 8-bit (or Commodore) joystick ports, and allows for all types of configurations of what responses the extra buttons provide.

In a message dated 7-3-95, Mathy Van Nisselroy said:

"Man, I wished there was an 80 columns 256 (or more) color
upgrade for the classic Atari."

Perhaps someone needs to turn Mike at FTe on to the Yamaha 9938 or 9958 VDP chips. They'll provide both 80-column output and have 256-color modes, interface easily with an 8-bit bus, are compatible with NTSC scan rates, and use their own RAM.

Both provide RGB analog output, while the 9938 also does composite. The 9958 loses composite output (which if needed, can be generated externally from the RGB output), but adds some goodies such as horiztonal hardware scrolling and YJK mode, which is a HAM-like mode that allows over 32,000 colors on screen at once.

Oh, and they both have hardware sprite support, also.

I don't know how much you remember about your Atari, but if you have all four of your drives daisy chained and have a bad cable? Or if two or more of your drives have the switches in the back set to drive 1? It wouldn't hurt to clean the heads just to make sure. The drives only have one head each. Also, do you have any other peripherals that DO work on the serial port? It could be the computer's port that is not working right. As a matter of fact I bought a 1050 from a thrift store today for $7. It acts about as strange as anything I've seen. It will read disks if DOS is loaded, but it will not boot a DOS disk. Except for WARP DOS. That it loads. It also will format a disk in WARP DOS, but it won't format a disk if any other DOS is loaded, even DOS 2.0.

It won't write DOS to the disk. The error I get back is that the floppy is write protected, but it's not. It also writes for quite a while, making the usual write sounds, before it gives me the error.I tried the drive mechanism in another drive and it works fine, so it's in the electronics. I have DIAG1050, which the drive passes all the controller tests, but fails the pattern test. I'll send you DIAG1050 if you are interested. I also have DIAG810 if you have any of those.

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <141777@cup.portal.com>
Source record: 90163

Sure, it's my favorite tool for the Atari, but I'd guess 90% of
the people who bought them just used them to crack games. One of it's
better features is it's written to be compatible with all software. The
only thing that wouldn't run under it was something like Roklans Gorf, but
even that could work after a fashion if memory serves me right. It is also
mostly XL compatible as far as the graphic modes go. The only modern software
I had trouble running was SD 2.3 because of the way it used the RAM under
the OS. When I was doing my IBM disk reader the first attempts were all
done from Ominmon. If you've ever used a debug for the Atari ED/ASM cart,
then that's the type of envirionment you have. All you do is hold down
the <SELECT> key & press <RESET>. The monitor program then comes up with
everything intact, even cartridges. So for example, you can put a game
cart in the computer, go straight to the monitor by holding down the
<SELECT> key, then disassemble the cart or save it to disk or boot dos
of jump to the cart, ...
It also has a built in assembler, so you can write small routines. For
instance, I had to exclusive OR all the data from the IBM disks, so what
I did was used the built in disk I/O to read a sector into memory:
R1 2000 ;reads sector #1 into memory at $2000
I then wrote a small bit of code on page 6:
Y600 LDX #00; after the 1st 'Y, eveything but the op codes is automatic
LDA #$FF
EOR $2000,X
STA $2000,X
DEX
BNE $602
BRK
or something like that anyway. Now all yopu have to do is:
J600<return>
<START><RETURN>
& the program runs & converts the data, then returns you to the
monitor. (OK, I know I'm missing a byte, should'a started with
LDX #0 & INX, online sigh).
Once the data was converted, then I just dumped it with:
D2000 20FF
Since you can read/write sectors, it will let you back up non
copy protected disk. Even has it's own built in DOS for directories
& loading files. If you program in basic, it runs about 30% faster
under Omnimon. I'm really a fan, it made my life much easier. Perhaps
a small write up should be done for people who buy Omnimon equiped
computers without the docs.

I've been lurking for a little while now, so I know that there is an IBM emulator for the Atari 8-bits. I'd appreciate it if someone could point me in the direction of the emulator.

Also, does the emulator allow an IBM to read Atari disks? If not, is there another program that allows this?

It can import and export files quite hapily from disk images. I haven't
used deejay for a couple of months, but if you want to know how, I'll have
another look (I'll be using it this weekend again anyway) and would be happy
to say how to use it - I was supposed to be doing English docs for it anyway,
so I guess you can all blame me... Sorry Kolja!

Richard.

PS. I've never had _anyway_ sync problems with deejay and the cable Rick
Cortese made for me - which doesn't use the MAX232 chip.

>the Atari 8-bit world these days? Who makes software? Someone chat with
>me.
Most people here have gone smart too. Personnaly, I'm writing to you on a
Hewlett Packard Vectra XU 5/90. Very nice machine. But if you want to program
on this, it's all standard stuff, operating systems, and absolutely no
hacking. Perhaps I don't have enough imagination to have fun with modern
machines. Well, in fact, I do things on these machines, but the creativity
isn't in the programming any more.
On Atari 8 bit, it is a very different thing. Programming is really fun. And
you always know what you're doing because you're so close to the machine.
FYI, some people are still developing games on the 8bit. To cite two of them,
there are Bill Kendrick and myself.
If you have the occasion, try to download the demo of FREE or Bill's games
from ftp.xmission.com (in /pub/users/j/jeking/8bit/games)

>Ah, those were the days. Mule after school, or Miner 49er. God, I wish I
>could go back.
Why can't you? It's relatively easy to find a second hand 8bit for almost
nothing. Or you can try the new emulator for Mac. Mail
lamcw@helios.aston.ac.uk for more information.

Bye.
Bertrand

From: sharris@bobcat.ent.ohiou.edu
Message-ID: <DBAq5n.DyA@boss.cs.ohiou.edu>
Source record: 90298

Hello,
I'm the guy who got back into Atari by buying a whole systme
at an auction for really cheap. I got 4 disk drives with
the deal, but it appears that only one works, and I was trying it
last night, and I'm not so sure it works. One drive is totaly fried
and won't even spin a disk when it is put in. Two of them seem
okay, but I am unable to boot from them with boot disks, they give
me boot errors. The 4th one will boot from disk, so I thought
I was home free. I was checking out AtariWriter cartridge last
night and I figured out you have to turn on the computer with
the Master Disk 3 in the drive with it on and the cartridge in
the slot. This must prepare the drive plus boot from the cartridge.
So I tried to Format a disk, and it ran for a long time like it was
formatting it, and then it gave me an I/O error. So I wonder
if this means the drive works for reading but not writing. Is
this a possible explanation? Are there two different read and write
heads? Am I doing something totally wrong, or do you think the
drive might be bad? Do you think a disk cleaner might cure
my problems, even with the other 2 drives which won't boot?
Thanks for any help. Please e-mail me,.

Steve

>emulator. Is there a blank high capacity disk image floating around at
>umich somewhere?

If you take an existing disk image file and just make a copy of it,
you end up with exactly the same capacity disk image. Pretty obvious.
What you want to do is create a really big disk image, right? One way
to do it is to combine XFD files. If you take two single density 90K XFD
files and copy them into one large XFD file, you've now created a double
density 180K disk image. Duplicate and combine that and you have a 360K
quad density disk image (what XF551 drives can produce). And so on. I've
made multi megabyte disk image files this way.

Boot that new disk image as D2: while you boot a regular
MyDOS disk image as D1:, then tell it to format D2: specifying the
size of the new disk image.

You can also do it with ATR files. Just run SIO2PC and tell it to create
a disk image of whatever size you'd like.

Jeez-- no, I don't remember.

Let's see, I never had a modem until 1991 or 1992.
I got Action! since then.
I got Mapping the Atari and De Re after that.
I had a disk drive since the mid '80's, though.. but very little software.
I never had an issue of ANTIC, ANALOG or any other Atari-only magazine
(although I had ANTIC's Anthology vol.1 which was FULL of misprints and
typo's! ARGH!)
I did have some old Compute!s and Family Computing's, though..

I do remember when I first got TurboBASIC XL and had all these plans for
great games (as usual :)).. But then I got Action! and all of those plans
were dropped. :)

Remember, those of us here in c.s.a.8 obviously DO remember the old times,
since we're still here in the new times!

Go get an 800XL and a Sweet16 and some HD interface and be happy again. :)

Message-ID: <3thnmg$90s@newsbf02.news.aol.com>
Source record: 90305

Alan, this is where I BOUGHT (yes, laugh if you will) my emulator. It is called XFormer 3.0: (newer version coming soon to a software store nowhere near you)

Toad Computers
570 Gov. Ritchie Highway
Severna Park, MD 21146-2925
United States
tel: (800) 448-8623 Orders
URL:mailto:toad@charm.net (fast response)
URL:ftp://ftp.charm.net/pub/home/toad/
URL:http://www.charm.net/~toad/
Vendor: new/used hardware, new/used software

OK, so now you have the software, but how do you get an atari programs onto your IBM/compatible?

This is one method:

There is a CABLE (lets call it a cable) that connects your IBM to your ATARI. It allows for interaction between both systems.
You can get it from:

Nick Kennedy (for his tele# just call information in
Arkansas)
300 South Vancouver St.
Russellville, AR 72801

Now you're in business. Actually, you can use the cable and your IBM to act as your atari disk drive, so the cable is fun by itself! When your atari drive dies, you are still up & running.

About the emulator: It runs a lot of stuff, but is not perfect. You have to play trial and error to see what works and what doesn't. Luckily, with newer versions on the horizon, we will see an improved product.

Hope this helped.

I've tried to download the FREE demo from xmission. I binary downloaded, ungnuzipped, and made a disk from the DCMs with discomm 3.
Everything went fine, but I haven't verified if the second side was good. It decoded fine with discomm but I can't verify it here because I have only PC-Xformer 2.5 for the moment. Has anybody verified the second side?

PLEASE could anybody having problems with FREE e-mail me? Otherwise, there's not the slightest chance to solve them. Thank you in advance.

Bye.

994. 800XL chroma mod?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-07 00:00:00 UTC
From: psu01223@odin.cc.pdx.edu
Message-ID: <3tiff2$pej@odin.cc.pdx.edu>
Source record: 90166

Sorry if this is a FAQ, but I can't seem to find it anywhere... I seem to remember that there was a simple mod to add the missing signal to the 800XL's monitor jack. Can somebody post this, or mail me, or give me the URL or whatever? TIA...

I picked up a Genesis controller for about $10 because most of my joysticks were either shot or had funny quirks in certain directions. It's wonderful for a lot of games (it's great with stuff like Archon), but since its diagonals are so senstive, it's not so great for other games (Epyx's World Karate Championship is a good example of this). It is worth getting, though -- it really helps out your wrists, too. Later,

One thing I thought about would be somehow wiring the start button into the
Atari's start button... then you could turn the A button into the select button
and the C button into the option button...

> Another choice would be to add a autofire circuit to one or more buttons,
> and rewire them into the standard "fire" line.

I don't know how useful this would be, since most games operating on the one
missile on the screen at a time wouldn't benefit from this.

> Hmmm...here's an idea for a nice hardware hack...an outboard "box" that

> of what responses the extra buttons provide.

One thought I had was using the drive I/O ports to network Ataris with programs
specifically designed for it, and maybe have some sort of two-player WayOut
kind of game. You know, plug each players joystick into their port one, and
then connect the two computers with the I/O ports... could be fun (could be
tough and frustrating). Later,

>Back to the 65816 itself, what happens if one is simply plugged in
>place of a 6502...

The 65816 is not pin-compatible with the 6502, so it wouldn't work.
The 65802 is supposed to be a direct replacement, and should work fine,
except that it does not give you 24-bit addressing, and I don't think
the chips are even being made anymore.

As you noted, all Atari's except the early 800 computers don't have
standard 6502's in them, and so you couldn't replace them anyway.

999. Atari 8-bit computer stuff -- FOR SALE/TRADE

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-07 00:00:00 UTC
From: dw901@cleveland.Freenet.Edu
Message-ID: <3tj9ul$hm2@usenet.INS.CWRU.Edu>
Source record: 90171

updated 07/06/95

I have the following Atari 8-bit computer equipment for sale or trade.

Everything is sold as is. Unless specified, all items have been tested and are in perfect working order.

Buyer has ten (10) days to send payment, and pays all shipping costs, which will be sent via U.S. Snail. The shipping cost depends on both the weight of the package and the distance that it is traveling. The buyer has the choice of either first class or parcel post (slower, but cheaper).

Payment must be made in U.S. funds, by either check or money order, drawn from a U.S. bank branch. Canadian buyers must send a Canadian Postal Money Order, payable in U.S. funds. This is the only way I have found to deal with my friends to the north (my bank is very picky, but the U.S. Post Office will cash a Canadian Postal M.O.)

*****

LOT #1

ATARI 400 COMPUTER with RCA cable, and 410 Data Recorder.

This is a complete system, except for RF switchbox and power supply.

$14.00

*****

LOT #2

ATARI 600XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second ATARI 600XL (haven't checked it out yet, so I don't know if it works or not), FREE.

This is a complete system, except for RF switchbox.

$29.00

*****

LOT #3

ATARI 800XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second non-working ATARI 800XL for parts, FREE.

This is a complete system, except for RF switchbox.

$49.00

*****

LOT #4

ATARI 65XE COMPUTER with original power supply, and RCA cable

This is a complete system, except for RF switchbox.

$39.00

*****

LOT #5

ATARI 130XE COMPUTER with original power supply, and RCA cable.

This is a complete system, except for RF switchbox.

MINIMUM OPENING BID OF $64.00

*****

LOT #6

This is an idea I had a while back, when I first got a Genesis
controller and wanted to use the extra buttons without modifying the
controller itself (You never know, I might get to use it on a Genesis
some day!!) Anyway, it would be nice to have some sort of standard on
using the extra buttons, so that a lot of people don't come up with
different ways of doing it.

If someone does come up with a box, it should allow you to use one of
the buttons as the fire button on joystick 2. (If anyone's ever played
Spy Hunter, you know why!!!) Maybe this could be accomplished with a
toggle switch.

>this would only be good for custom software.

The ColecoVision used diodes to one of the paddle pins for the keypad and right fire button. Unfortunately, the 2600 can't read the ColecoVision keypad because the paddle outputs don't provide a good enough ground (I presume) for its RIOT I/O chip. The TIA chip can read the right fire button this way, however.

The interesting part was that each keypad key individually mapped a 4-bit code on the joystick input, using one to three diodes.

I tried out the free version (2.5) and had poor results, even with the
demos that came with it. The ones in BASIC ran fine. The
Robot/Spaceship was mildly goofed up: there was a group of messed-up
pixels on the robot and all the stars behind the spaceship were clumped
together. The Boink demo ran at about 1 frame a second, even on a DX4-100.
No problems with DOS or BASIC, though.

>util /i disks.

In light of the thread concerning the first three sectors being
double density versus single density, does util /i do a full
format of the disk in the PC, or just an initialization for
Atari??

If it does a full format, it could easily mean that the Atari
drive can work with either single or double density first three
sectors, but only formats them as single, or as 128 byte double.
This could cause problems on the PC side, which needs double
density exclusively, and may have trouble with 128 byte sectors.

I hav'nt heard of either of them PM editors but I wrote my own PM editor
in action. you edit the players directly (not on a bit- mapped screen) and
they can be moved around in any resolution you want. Also it has a bunch of
functions for fliping, reversing, overlaping, and deleting, inserting and
shifting on a single line. I use it for myself but it is'nt real tricky to
figure it out. do you
want it?

1017. Any sellers of 8 bit hardware?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-08 00:00:00 UTC
From: Michael.Fitzpatrick@flight.org
Message-ID: <038_9507081233@flight.org>
Source record: 90189

You could try Best or Toad for Hardware. CSS still is in business and you could buy a new Black Box from them. Besides all that the very best place to buy good used hardware is here on the nets.

1018. Re: CGA monitor <--> Atari 800? How?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-08 00:00:00 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <x09cvDt.lmcclure@delphi.com>
Source record: 90190

In a message dated 7-5-95, Chris said:

"When I bought the 800, I didn't have enought $$ for a real
monitor, now I've got several IBM PC CGA monitors that I'd
like to be able to use."

The 800 monitor output supports composite, monochrome (luma), and
chroma. This allows it to support both color and monochrome composite
monitors and split video monitors (or sources that accept S-video).

The 800 has no support for RGB monitors. However, the December 1993 issue
of Atari Classics gave the details on how to rig up a RGBI monitor (which
is what a CGA monitor is) to an Atari 8-bit.

However, while this application is fine for text, due to the manner in
which it was interfaced, it likely would not work too well for games,
as you were not only limited to 8 colors, but they were actually
controlled by the luminance (brightness) of the colors on screen (i.e.,
a next to the brightest color might give you yellow, while the color
next to the darkest might give you red, despite the fact the composite
output might be showing those as two different shades of green).

1019. Does anybody use DOS 3?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-08 00:00:00 UTC
From: lucius@astro.ocis.temple.edu
Message-ID: <3tkv7h$t95@cronkite.ocis.temple.edu>
Source record: 90191

I'm just wondering if anybody uses Atari DOS 3? For about 4 years it
was the only DOS I used because I didn't have access to anything else.
Now, I use DOS 2.5 mostly. I still have some games and files stored
on DOS 3. So now I wonder, how many people have had to use DOS 3, and
how long did Atari push DOS 3?

1020. Any sellers of 8 bit hardware?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-08 00:00:00 UTC
From: damien@wopr
Message-ID: <3tl544$gkv@news1.digex.net>
Source record: 90192

Hi,

I'm looking to purchase a 800 system with a black box, and was wondering if there was still a mail order business around that could take care of me, or if I have to buy the equipment from people on the net.

Any help would be appreciated.

1021. Re: Does anybody use DOS 3?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-08 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <141816@cup.portal.com>
Source record: 90193

In a word, nobody. There may be a few that used it for a while because
they had nothing else, but no one ever used it because it was good.
I may have my history a little off, but from conversations and or
articles I've had with Bill Wilkinson what happened was Atari decided
to develop there own DOS vs go to an outside programming house like
OSS who did DOS II. They used clusters of 1k for their file system so
the smallest amount of disk space that could be allocated would be 1k.
If for example you wrote youself a note of 25 words or less, it would
take up 1024 bytes of disk space. Eventually Atari did go to OSS &
DOS 2.5 came out.
Rick

: Howdy Rich

: Do these 130XE's loose BASIC or split CPU/ANTIC banking?

My 1-megger XE lost only BASIC (that is, it's controlled b a toggle
switch in the back), and I still have CPU/Antic banking abilities!
Unfortunately, it seems that the antic banking bit also switches a bank,
so it isn't that good.

Still, I don't think a 320XE loses any of these.

I hate to say it, but Atari dropeed support for all of their computers
recently and are back to beign a game company :P

Anyways.. here in Ottawa, the XE Group is still fairly active, although we
aren't getting as many users as we used to have, and more are dropping off
to other platforms :P

I believe CSS in Rochester still makes some software for the 8-bit.. that's
all I know of.

>standard 6502's in them, and so you couldn't replace them anyway.

Even though the 65802's are no longer available, "if" you can
find one "and" happen to have an Atari 800 with the old CPU cards that
used the standard 6502's, they will basically plug and play. I've got
a couple souped-up 800's floating around here to use when I don't need
the extra memory addressing that the 65816 supports.

The MARS 8 SIMM socket will be set up "exclusively" for '816
linear addressing. It will work with 256K, 1MB, 4MB, or even a 16 MB
SIMM (if you can find them... or afford them! <g>)

A Bi-directional port is still in the works... I can't commit
to one until production boards are here in hand though.

From: bmarcum@iglou.iglou.com
Message-ID: <DBFpyF.6nz@iglou.com>
Source record: 90204

Actually, I don't think there is any difference (between 4.50 and 4.53) in using Note and Point. The difference between the three- and four-digit numbers is that some programs which read the directory will not work properly if the file length is displayed as four digits (each line in the directory is one byte longer). Also, programs which read the directory often look for a line beginning with a number to indicate the end of the directory.
The Note/Point problem is different from the 3-digit/4-digit problem. The Atari Basic Note and Point instructions only allow a sector number up to 32767, while a hard disk partition can have up to 65535 sectors. So, with a hard disk you may have to use Peek, Poke, and XIO instructions instead of Note and Point.

1034. Re: Genesis controllers for 8-bit?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-09 00:00:00 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <JJJgggL.lmcclure@delphi.com>
Source record: 90206

In a message dated 7-7-95, Chris Carman said:

"One thing I thought about would be somehow wiring the
start button into the Atari's start button... then you
could turn the A button into the select button and the C
button into the option button..."

This would, of course, require some modifications to the Atari, as these lines are only present on the keyboard connector, not at the joystick port. Perhaps the most elegant approach would be to add new joystick ports to your A8 that would combine the regular joystick lines, as well as the console lines (routed to the appropriate pins). While these new ports could still be used with standard Atari-type joysticks, would not support paddles other other devices that required the analog lines, thus the reason for retaining the original joystick ports in parallel.

In response to one of my suggestion about adding a circuit to make one of the extra buttons an autofire button, Chris said:

"I don't know how useful this would be, since most games
operating on the one missile on the screen at a time
wouldn't benefit from this."

I have to admit I have not been much of a games player for many, many years. However, I hope this is not true of all games. If the A8 version of Defender does not support multiple "missiles" on screen at one time, it would really take away a big part of the arcade version.

"One thought I had was using the drive I/O ports to network
Ataris with programs specifically designed for it, and maybe
have some sort of two-player WayOut kind of game."

Its been done. I believe the system is known as GameLink, or something similar. In fact, I suspect by the time I post this reply, several folks will have filled you in on the details more completely than I can.

In case they haven't I will say their is a maze game out there that supports it, and the programming info for using it is available freely, as I understand it. If you haven't got responses on this already, and are interested, just post a general inquiry targeted specifically at acquiring info on GameLink.

1035. Re: Genesis controllers for 8-bit?

Newsgroup: comp.sys.atari.8bit

From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <JLBhIYM.lmcclure@delphi.com>
Source record: 90207

In a message dated 7-7-95, Bruce Tomlin said:

"The ColecoVision used diodes to one of the paddle pins for
the keypad and right fire button. Unfortunately, the 2600
can't read the ColecoVision keypad because the paddle outputs
don't provide a good enough ground (I presume) for its RIOT
I/O chip. The TIA chip can read the right fire button this way,
however."

Have you tested one of these out to see if the keypad buttons work with an Atari 8-bit? If not, I've got a Coleco Adam sitting right next to my 1200XL, so it should not take me long to find out. <grin>

"The interesting part was that each keypad key individually
mapped a 4-bit code on the joystick input, using one to three
diodes."

I also have a Atari CX-85 keypad (which plugs into the joystick port), but I cannot remember at the moment if it uses the POT lines or the joystick and fire line for input.

Of course, the problem with Coleco controllers and CX-85 keypads is that they are not readily available to everyone, while you can pick up a Sega joypad seemingly every place that sells anything electronic.

On a totally different note, I have often wondered if the Thrustmaster FCS, which interfaces with a PC keyboard, would work with a Transkey equipped A8. I suspect not, as I believe the programming is downloaded via a program ran on the PC, so even if the Transkey supported the AT keyboard bi-directional interface fully, a totally new program would have to be written to allow the FCS buttons to be programmed. (OTOH, if the setup memory in the FCS is non-volatile, one could program it on an AT compatible, then unplug it and use it on a Transkey equipped A8).

1036. Re: My 'natsukashii' continues

Message-ID: <BJJjY4B.lmcclure@delphi.com>
Source record: 90208

In a message dated 7-5-95, Peter Payne said:

"Of course the 8-bit Atari is the only computer worth calling
an Atari. The ST line was a ridiculously conceived joke."

Hey...watch that. Some Atari owners are bi-computerish. (In fact, some, like me, are polycomputerous). <grin>

However, the merits or lack thereof as regards the ST line is more the fodder for comp.sys.atari.advocacy, so that is all I will say on the matter.

"Remember the frustrating 1200XL keyboard (different from
the other keyboards), or its stupid help key?"

Most folks that have used a 1200XL keyboard for any length of time actually rate it quite highly. They will not only admit it had the best layout (the first time you hit "BREAK" on any other A8 keyboard when you meant to hit "DELETE", you'll begin to understand why), but had the best "feel", second only to the original 800. The question of how to adapt a 1200XL keyboard to an 800XL or XE model has come up more than once in this newsgroup.

As to the "help" key, the only thing stupid about it was that software was not written to support it. Basically, it was just an extra key that happened to be labelled "help", but unlike F1-F4, which defaulted to cursor control, Atari assigned no default value to it. (BTW, a lot of folks like the one-touch cursor control on the 1200XL keyboard as well).

Sorry, I've been on vacation, all of last week. Been on
Lake of the Woods fishing. (That's on the border of USA and
Canada.)
To answer your question; No, you don't lose BASIC,
But you do lose banking. It's the standard Scott Peterson upgrade.
It does take about 3 to 3 and a half hours to do, mostly de-soldering,
wiring and re-soldering. Newell makes one that does maintain the
CPU/ANTIC banking intact.
I've been running one since - - - ? - - - since the article
was posted on GEnie. 1988 I'll guess. I did make an addition. A
external switch that returns it to true, 130XE compatibility.

1042. FlickerTerm 80

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-09 00:00:00 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <5S7-HT-.ransom22@delphi.com>
Source record: 90214

Hi all,

I just downloaded FlickerTerm 80 from James King's xmission.com
site (my first use of that site....I like it! I like it! [G]), and now
that I am using it, I must say I am pretty pleased.
For the last several months, I've been using FT80 .32, and loved
that as well. But the new version's macro facilily, as well as it's
improved font, make it even more useful. Great job, Mr. Halliwell!
I highly recommend FlickerTerm 80 to anyone who wants to use
his or her ATari 8-bit to call out with 80-column capability. I use it
on Delphi (which requires VT100 emulation) and on local BBS's (which
do much better with IBM PC/ANSI emulation), and it does the job well.
I am also now using it with SpartaDOS X, which I didn't know how
to do before. Thanks to the troubleshooting documentation included in
flickerterm, I was able to find out what the problem was and solve it.
(I have the key buffer on, which conflicts with FT80--I just made a batch
file to turn KEY OFF, load the RS232 handler, then run flick80 -- works
great.)
Ahhh...macros, fonts, using the CX85 keypad....I love this
software! :)

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <141918@cup.portal.com>
Source record: 90215

I believe FTE took over all the Newell products like Omnimon & ram upgrades.
I'd bet there's also some at B & C Computervisions in Santa Clara CA. They
were a little pricey when I got mine. I think I paid $79 for each for
the Newell boards that let you have 3 OS/switch selectable. One had Omniview
& the other Omnimon, then I bought one more Omnimon chip for $39.95 I think.
CSS sells a similar chip/OS replacement that's supposed to be quite good, but
the info I've got so far is that it uses up a lot of the free hardware space
in the $DXXX region. Omniview is really not that good, just 80 column in
OS software, best compatibility, fast FP routines, & ATR8000 terminal in
80 columns. BUT I don't have the CP/M disks for my ATR & even if I did I
don't think there's that much CP/M software I need to run. 10 years ago
running Wordstar for CP/M on my Atari would have been deluxe, but it's
a little academic now with all the WP software I like better then WS.
I ended up buying an 800 for running anything that Omnimon won't & ususally
just have an XL OS & Omnimon chips piggybacked in a 1200xl as my favorite
computer. It a little goofy, but you can still look at anything you want.
I boot the software with the XL OS, hold down the reset key, switch the OS,
hold down the select key & release the reset. Viola! You've got all the
text from AR or hints from the Bars in Ultima!
BTW: I'll try & get that HW to you next week.

I've got a ton of old Atari 8 bit hardware and software to sell only for
a reasonable price.

List :

Atari 800 48K computer
Indus drive
Happy drive
At least 30 Atari cartridges of all the popular games
At least 500 Atari disk games of all types
Atari 1050 Computer
Atari magazines, Antic, Analog, Compute, ref books etc..
A ton of blank 5.25" disks
850 Interface
Panasonic 9 pin printer
Epson MX 80 printer
Box of computer paper pinfeed type
Joysticks by Wico

Also got a C64 and drive and Amiga 500 and external drive

If anyone can give me an offer for a prce I consider fair, then I am
willing to sell all (has to be all or nothing)

If there is anyone in Alberta that is interested, that is my preference
as they can view it in person, else everyone is welcome to submit an offer.

1047. Atari 600 (not 600XL, 600) ?!?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-09 00:00:00 UTC
From: 6500dtpt@ucsbuxa.ucsb.edu
Message-ID: <3tpbvi$a42@ucsbuxa.ucsb.edu>
Source record: 90219

I have been reading through a lot of old COMPUTE!
magazines from the very early 80s (1981-83) and there
are numerous references to Atari developing an Atari 600
(not 600XL! this is well before the release of even the
1200XL) to serve as a middle machine (or a replacement
for the 400)...it seems that it was going to be
a 16K machine with a full-stroke keyboard but there are few
details. Does anyone know about the planned Atari 600?
Anyone have one or ever seen a prototype?

(PLEASE don't send me message or post followups which say
"yes, the 600XL came out and it is like the 800XL but with
16K and no monitor jack..." - I know about the 600XL; but
am curious about the Atari 600)

1048. nir-PAL: NO SUCH THING!!!

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-09 00:00:00 UTC
From: b.poehland@genie.geis.com
Message-ID: <199507092122.AA133474938@relay1.geis.com>
Source record: 90220

Man, who started this stupid thread "nir-PAL"? What a classic example of how nonsense gets spread around on networks, like so much fresh manure.

THERE IS NO SUCH PRODUCT GOING BY THE NAME OF "NIR-PAL"!!!!!!!!!

Did I make that clear to everyone?

Okay, FOR THE RECORD:

There's a guy in California by the name of Nir Dary. He's an Israeli citizen studying computer animation/graphics in the USA. He was formerly an electronic technician in the Israeli Army. He's an Atari enthusiast, & he's a member of my usergroup (Ol' Hackers, in New York).

Nir has developed an upgrade which calls the "PAL-NTSC Upgrade". Everyone understand that? Please, henceforth let's call the thing by it's correct name.

The upgrade consists of a PAL ANTIC chip plus a modified OS ROM. If your XL/XE has sockets for those chips, installation is a no-brainer.

As Jeff Potter mentioned, it is indeed true that you can get by 90% of the time running both PAL & NTSC software on an XL that merely has had the NTSC ANTIC replaced with a PAL ANTIC. However, some European software uses PAL-timed key repeats (or something like that, I'm not a programmer). Such software may crash or give jerky movements using the keyboard timing given in the NTSC XLOS. (Don't ask me which software programs they are, this is just what Nir told me.)

The OS modifications Nir did was to change the key repeat timing in the OS to make it compatible with those few European programs that use PAL timing. All the other nonsense that people have been conjecturing about the OS changes are just that: nonsense. He only changed the key repeats, nothing else.

Last week he told me he was working on a disk-based fix that might remove the need for a new OS. Some kind of program that will shadow the ROM into RAM, make the fix, then run the OS from RAM (if I understood him correctly). As far as I know he's still working on that.

Nir is also working on a draft of his docs for the upgrade. He's supposed to be sending that to me any day now, we have an agreement whereby I'll be editing his docs for final production (Nir's English is a little weak).

I've been beating up on the guy to go on-line somewhere & join this newsgroup, but he steadfastly refuses, claiming that answering e-mail will take too much of his time (he works long hours in addition to his

classes). Well, I can't argue with his reasoning.

Anyone wishing info about the PAL-NTSC Upgrade can call Nir Dary
at home, in the evenings only, at: 818-831-2353. Or, write to him at:

Nir Dary
19185 Castlebay Lane
Northridge, CA 91326-1046

Please make creful note of the above info if you are interested in
this upgrade. This is the only time I will post this information.

The ST line were never really much better than MACs outside of price.
And once the MACs got faster and more colorful and got more software,
nobody bothered to stick with the ST and that was it.

The Jaguar gave Atari the necessary hope and collateral for loans and what
not, to survive in its smaller capacity for a while. It bought them time,
but that time is fast running out. With the Tramiels in charge, the
company can only follow a downward spiral with an inevitable conclusion.
It matters not what their product is. It's only a matter of time.

And just think, prior to Flick, the fastest you could go with VT100 was 2400 baud (with data loss with more than a screenful of text). That was a big problem with the Atari8 for YEARS. Bobterm came out and supported fast 40 collumn but there was no similar replacement for vt100. This was a big problem because of ANSI boards taking over (essentially ANSI is a superset of VT100) and internet unix shell dialups becoming commonplace.

And you had everyone saying "it can't be done" due to the previous methods using gr.8 screen blitting rather than Clay's clever Gr.0 pageflip trick. This, combined with fast screen and modem routines, have redefinied the Atari8's upper-limits and increased its usability in a key area.

FOR SALE:

8-bit equipment as follows:

2 - 48K 800s, both 100% functional

3 - 810 disk drives. Two are 'archiver' modified, 100% functional, third needs alignment, but otherwise good.

2- 850 interfaces, both 100% functional

1 - 16K 400 w/membrane keyboard

many spare parts, including some original Atari factory diagnostics (both firmware and hardware)

1 - 48K RAM upgrade for 400, in box, but never installed

1 - spare MPI 810 mechanism, needs alignment

I prefer to sell this as a package, but will consider selling larger chunks instead. Best reasonable offer. Buyer pays shipping and insurance.

Source record: 90228

<gulp> Ben, I think I started the thread! <cringe>

Thing is, I had only ever HEARD it called "nir-PAL". I don't remember by whom, but ever since I thought that was what the name (or at least the slang term) was! Sorry for using it! (although this apology, IMO, isn't really all that needed.. but hell, I say sorry every other sentence.. ask my girlfriend)

Anyway, re: key repeat speed. I assume this is the XL address 730 ($2DA), right? It doesn't say in Mapping that it's a shadow register, so I'd guess all one would NEED to get the thing set up would be a simple exec-utable which changes the repeat speed.

Binary load file would be:

255 $FF
255 $FF
2 $02 dammit- I still can't remember if it's MSB/LSB or LSB/MBS
218 $DB for binary load files!!
xxx $xx whatever the speed is set as on PAL OS

I'd think you could simply run that before you run PAL stuff.. or set it via an AUTORUN.SYS or *.ARx (MyDOS) file or put it in your AUTOEXEC.BAT (SpartaDOS).

Of course, I could be wrong- but it's CERTAINLY a MUCH simpler hack than replacing the OS chips, and MUCH more reliable than using the RAM UNDER the OS AS the OS, seeing as many programs USE that RAM for themselves!

I can't wait to see some good Euro. stuff for the Sweet16! :)

Oh, and BTW- Ben, you scared the daylights out of me! I thought that the upgrade was either a hoax (I get confused quickly and easily, ok? sorry! :)) or it was a vaporwared product..!

WHEW!

Yes, I know about FTe as well. I completely forgot that Fte also release about 3 or 4 new version of SpartaDOS, though.

But it is fact.. Atari has dropped *ALL* support on their computers, and are back to being a game company, which I personally think has to be the dumbest move they've made as of yet.. with a machine like the Falcon in their hands, they could have been up there with Bill Gates right now. Of course, the idiots didn't advertise teh Falcon and wonder why they didn't make much money off of it :P

What a waste...

On the other hand, if they get their butts moving on the Jaguar, they could make some real money. So far, I haven't seen the Jaguar put out its very best, though.. it's really too bad. :P

Atari is going to be up there with Amiga one day.. a company that made computers a million times better than IBMs, but didn't make enough money. :P

If your drive is an ATARI 1050, have you considered the possibility
that the drive belt may have worn through with age ? Without the rubberband
for the motor, the drive spindle won't turn. If I remember aright, you
can order replacements from BEST ELECTRONICS or AMERICAN TECHNAVISION or
specialty electronics stores.

There are a few dealers left who can still get Falcon 030's (Atari has a
warehouse full of 'em), and some old stock of other machines. The ST
group is active for the reason this group is - people using discontinued
platforms. Only difference is, many ST'ers have strange disillusions
about the ST making some form of comeback, whereas 8-bitters never have
to worry about how the 8-bit is selling. :)

Jesse; that guy Bob was Bob Brodie himself. You guys are both about
1/2 right, the 1450XLD existed, but only as prototypes. I saw
three for sale at an Atari wharehouse sale. They had hacked up 1400XL
cases so stuff would fit. For a while B & C was selling 1400XLs
for something like $150 if memory serves me. But once again, it was
never really a product Atari marketed. What they seemed to do was
make a small production run of less then 1k computers, send these out
to developers, then decide not to market/mass produce the computers.
Ocasionally somebody like B & C or Best get's a line on these computers
& makes them available. A huge amount of stuff existed at Atari, but
that doesn't mean you ever got a shot at buying it, so from a consumer
stand point you could say it never existed.

I got a character into Santuary, but I started him out in City. Being good is tough, but not impossible. Problem is once you start duking it out with good characters you get a bad rep & then all good characters strike the first blow. Remember even thieves are good! You also can't go into Santuary until you are up there in levels, 5 or 6 if memory serves me. You should be able to ask to be evaluated by a priest, if he says;
Your soul is black as pitch!
Give it up, you're screwed. If he says
"You're on the right path"
Then your almost there. My character only commited one evil act, charmed someone who attacked him when he first arrived at the floating gate, but this gave him enough coin to buy a dagger. That was the only time he killed *ANYTHING* while the sun was up for the rest of his career!
If anybody did pick a fight with him during the daylight hours, he ran. None of that 1st blow stuff, just leave. I made the mistake of killing thieves who tried to waylay me in the Dungeon & the Thieves Guild sent an assasian after me, & I was a member!
Best way to get into Santuary IMO is to never fight with anybody from about 6 am to 10 pm, lurk around an inn in the bad parts of town from 10 pm to midnight & evil creatures will attack you, these you can kill & they have the best stuff. Always be in bed by midnight as you gain the most hit points sleeping from 11 pm to 7 am. Be well fed & watered also before you go to bed. Save the game everytime you do something right & back it up.

: The mortal Joe Walsh wrote:
: : Ahhh...macros, fonts, using the CX85 keypad....I love this
: : software! :)

: And just think, prior to Flick, the fastest you could go with VT100 was
: 2400 baud (with data loss with more than a screenful of text). That was
: a big problem with the Atari8 for YEARS. Bobterm came out and supported
: fast 40 collumn but there was no similar replacement for vt100. This was
: a big problem because of ANSI boards taking over (essentially ANSI is a
: superset of VT100) and internet unix shell dialups becoming commonplace.

Wait...

I thought the VT100 Ice-T would go at least 4800 reliably and to 7200 or
so baud before it begins to break up a bit?!

It does work at 9600 baud and even 19.2 but slows down the screen updates.
I have clocked it locally at at least 14.4 (right at 1500 or so + cps)!!!
About 7200 or so baud on-line. (Running with Ice-T 2.0). Thanks Itay!

Speaking of the "new" version 0.51 FlickerTerm 80, especially with the new
font - it looks very good! The new font is much sharper than the old,
default one. It is great to see two decent VT100 emulation
telecommunications program for the 8-bit! Thanks Earl!

Yep! Multiplayer games were and are the most fun when playing with a friend.
Why not create a two (or four) player game, using two Atari's connected
together that is purely FUN to play. Of course a DOOM clone is out of the
question :). Say, either an adventure game where two players can be enemies
or allies, or an action game where the two players would more likely be
enemies. Keep it fairly simple in nature, and make it more playable over a
period of time. Loadable modules or data for some dynamic situations.

Of course one would have to have two Atari's for this, and would not be for
emulators... ohwell. I still think it's a potentially cool idea.

Mike Hohman announced the availability of SDX 4.22 on GEnie the other day. This version has selectable SIO enhancements that allows standard SIO call. Things like SIO2PC, MUX and Corvus HDs (w/Integrator Boards) are supposed to work properly now.

The new PROM(s) is $12.95 for current SDX owners along with $3.00 S/H. Mike didn't say whether you needed to mail him the old cart or not. I'm checking on that.

1087. "util" transfer program

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-11 00:00:00 UTC
From: rotney@cris.com
Message-ID: <3tsiu0$3jc@warp.cris.com>
Source record: 90112

Has anyone used the "util" program to transfer 8bit atari disks to PC disks? I tried it this weekend and was only able to transfer about 60-70% of the stuff. I got a lot of errors. Some files copied over fine while others on the same disk wouldn't.

Would I get better results if I used an old 360K drive rather than the 1.2M one I tried it on? Doesn't the 360K have more "tolerance" than the 1.2M? Any help appreciated. Seems all the crummy stuff transferred fine but the ones I want most didn't.

Scott (rotney@cris.com)

Am I the only one in this News Group that gets
"Atari Classics"??? On page 15, Nir Dary explains it in an
article. Also, just beneath it on the same page someone
(Editor?) has added to the article calling it "Nir-PAL Explained".
The OS tweak is to set the PAL flag at $C386 to
$01 to say that it is a PAL system. This has to be done
because it (PAL flag) is normally read from $D014, the GTIA
chip. The GTIA is NTSC, so OS has to be tricked.
Remember, you changed only the ANITC chip to a PAL
version.
I hate long posts.

I have tried calling his BBS, but was never able to get past the busy signal.
I sure do love the Xmission FTP site though. If money is a problem for
maintaining it, maybe we could all pitch in to keep it going?

Yes, and it was up for what, James, 7-8 years?

No, it has to be longer than that.

Semi-regularly, when I was a little kid and The Source (what the BBS
was called at that time) was LD for me, I'd call it because it was the
best BBS around.

>Also, DON'T CLOSE your XMission site! I've filled my hard drive a few times

I agree with that sentiment. It's too bad that people don't realize
that (c) means nothing when it comes to 10 or 15-year-old unsupported
8-bit software.

Bill - why not a simple Doom clone? Look at:
The Eidolon
Capture the Flag
WayOut
Alternate Reality: City
Alternate Reality: Dungeon
Amazing Maze
and Maze of Agdagon (Gamelink itself!)

The first three have very well done 3D animation - no 90 degree turns like the bottom four.

Capture the Flag even has two screens being drawn at once, as well as a map! This type of engine might be ideal for a Gamelink game.

The Eidolon has very nice graphics, albeit a little lacking in detail for how detailed it is :) If that makes ANY sense. :)

I've not seen WayOut for the Atari 8-bit, only for the C=64, and that was YEARS and YEARS ago.

We could easily clone Spectre, NetTrek, very simple versions of Doom/Marathon.

Heck, ANY game that can be two players can be done even BETTER via Gamelink- think about it: two players on the same computer is not only cramped, difficult to use with the keyboard (for games that would want more than just up/down/left/right/Fire) BUT has to generate enough screen stuff for TWO players, not just one! With Gamelink you're not only network-gaming, you're more or less multitasking when it comes to the userinterface! :)

Anyone got a spare 800XL and some Action! GameLink II code handy!? :) :) :)

which 8-bit Atari computer system was the best in terms of game graphics/sound, etc.?
I've bought a few game cartridges but am not sure which machines I can run them on.
I know I used game carts with the 600XL, but I'm not sure about the 130XE.
I have Defender, Asteroids, Centipede and Millipede.

Is there anywhere I could find a list of cartridge games that were released for these
8-bit Atari systems? There's a list for the 2600,5200 and 7800, but
not much was released for the 5200 or 7800.

I know there were prototypes of arcade game ports done on the 5200 and 7800, like Tempest
and stuff, but were any of these cool arcade ports actually released on cart for the 8-bit
computers?

Any chance of getting these cart games put on disk so I can use them
with PC XFormer? (or would this be illegal? Seeing as the games or the systems aren't
even manufactured anymore, and aren't too easy to find, I don't see a
problem in doing this. Has anyone tried?)

Now that all of us who stalk yard sales have 8-bits piling up in our
basements, how about using the same Gamelink technology to do
a one-player, multiple screen game? Like Way Out or a flight game
using 3 screens to show side views?

Stan Woynarski <swoynars@eagle.wbm.ca> wrote:

>which 8-bit Atari computer system was the best in terms of game graphics/sound, etc.?

There are arguements on this, but with a good video cable and TV all 8-Bits are essentially equally good, especially for games. If you're pushing the limits, as in an 80-column emulator
then fine distictions can be made between models and setups. A composite monitor helps a bit. A monitor with separate chroma/luminance inputs helps more (then you have to worry about getting a model that has that kind of output--800s, 800xls, 130xes).

>I've bought a few game cartridges but am not sure which machines I can run them on.

Almost all cartridges run on almost all machines. A very few 400/800 carts will not work on xl/xes, but you might never run into one. Likewise, I believe a very few of the later banked
memory supercarts may not work with 400/800s.
>
>I know there were prototypes of arcade game ports done on the 5200 and 7800, like Tempest
>and stuff, but were any of these cool arcade ports actually released on cart for the 8-bit
>computers?

The 5200 was essentially a lightly modified 8-Bit, and I think most everything available for the
5200 was also available for 8-Bit (with mods needed for having only one trigger button on the
8-bit). I think almost every early "golden era" coin-op game from Nintendo or Atari is available.

I think the legal issue would only come into play if you made copies available to others. However,
the process of copying is usually difficult. There are a few old utilities around to do this (I haven't
tried it in over 10 years, so there may be something new I don't know about), but they usually
didn't work on any but the oldest and simplest games. Later stuff also required a software hack,
as most carts had some kind of protection scheme (like part of its code would be constantly trying to overwrite itself in memory--impossible if running from a cart ROM, but instantly wiping

something critical out if it had been loaded into RAM).

If you mean capabilities, no Atari 8-bit is better than any other when it comes to graphics and sound, except:

older 400s and 800s lacked the GTIA graphics chip which added 3 new (very) low resolution modes

the 130XE (and many other RAM upgraded 8-bits) can do ANTIC banking, which makes the graphics capabilities a LITTLE bit more advanced

If you mean actual output, well, others know better than I, but many seem to think the 800 was pretty good when it came to video and sound. People think the 1200XL sucked when it came to video out, but when I got my replacement motherboard from Bob Woolley (adding 256K RAM (total) and 800XL/800 OS) he said it also had better video out, but liked my old, stock 1200XL's better!

1100. Xmission ftp site

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-11 00:00:00 UTC
From: jeking@xmission.xmission.com
Message-ID: <3tsose$n9r@news.xmission.com>
Source record: 90125

Well, I'm all out of space on my Xmission FTP site.

In addition, somebody has emailed my provider whining about a couple of (c) files available there.

I guess I'll just start removing files until 1) I clear out enough free space to accomodate NEW uploads or 2) I decide to just bag the entire FTP support site (like I did with my BBS -- yep, it's history).

If folks are going to complain about the content, while ignoring the lack of support and availability of no longer sold programs, then screw it -- why should I bother to take this hassle and PAY for it to boot!?!

I'm probably one of the BIGGEST supporters of the 8bit Atari. I've bought virtually every (c) package in existance, and still continue to gobble up all of B&C, American TechnaVision, Toad, CSS and San Jose Computers products -- and have supported shareware/private programmers by purchasing their materials.

How many of you have DD3, SBS, Maze of Agdagon, Colorview, Textpro, Bobterm, PabQwk, BBS Express Pro!, Textpro Manual, etc.. and have PAID your shareware fees? I HAVE!

Yeap, I believe I made it into the Light Wizards, but only with the good character. *BUT* as I recall, he couldn't join the Chaos Guild<???> & maybe one or two other ones you needed two be evil to get in. I remember thinking the spell list was slightly better for good Guilds vs Evil ones.
The first guy I brougth down was an evil character, but I gave up on finishing the game with him & switched to a good guy. After I finished the game I went back & completed it with the evil character so IMO it's not impossible to finish with either type. It just seems to take longer with evil characters because you get in a fight every few steps.

From: jeking@xmission.xmission.com
Message-ID: <3tspeq$n9r@news.xmission.com>
Source record: 90130

Will trade my entire BBS Express Pro! x324 package (includes all original disks, manuals, etc..) straight across for the latest revision of Carina -- or the Forem XE package with the BasicXE cart.

any takers?

I'm sick of the infighting constantly going on the Pro! networks. The owners themselves could careless if all Sysops dropped their product. You'd never guess there was a customer:company relationship there considering the threats that are levelled!

My BBS will remain down until I can acquire a more "suitable" BBS software package.

: Ahh! <:^[You closed your BBS!? THAT SUCKS! (I've never called, WAY LD,
: but I was always very happy to see such a HUGE supporting board). Why did
: you close it?

I closed my BBS for two reasons:

1) I barely got any callers -- and to keep my two tower cases (800megs
takes a ton of drives/power) running 24 hours for 1 caller a week to
access it simply wasnt worth the cost:benefit.

2) I got sick of the threats levelled by the owner(s?) of Pro! They
have absolutely no clue when it comes to customer relations. Their idea
of customer relations is to level threats and smash those that DARE to
ask questions or critisize(sp).

If I can pick up a decent copy of Carina 2-3x or Forem XE, then I'll
consider putting all those files back online.

: Also, DON'T CLOSE your XMission site! I've filled my hard drive a few times
: over today because of it! (Seriously! Of course, it's only a 20Megger.. :))
: The reason many people have ended up using your site is because they all whine
: that Atari.archive is too hard to get into or too slow. (I ALWAYS say
: "just try amiga.archive" and warn them of the messed up "cd" command..
: I get in 99% of the time I go there. And to download, I simply gopher to
: gopher.archive)

I havent made any decisions yet - but space is at a serious premium right
now. I'm currently struggling to free up 200k <grin>

: How much do you pay to keep the site up? How much would it cost to get
: a few more megs?

I'm paying $25.50/month right now to keep my Xmission account active -
about $10 of that goes toward the FTP site. Another $5.00/month would
give me additional space.

|>
|> MUST this be the case? Can you just do:
|>
|> Computer 1-whatever boot off floppy

Maze of Agdagon won't work if you try it this way. Computer 1, having booted off the floppy, knows it's the "Host". The versions of the game program that all others "boot" from Computer 1, tells them they're not the Host.

The Host has the responsibility of polling all others to ask them "where are you and what is your status?" All computers listen to the response.

If you wrote two versions of the software (one for Host, one for others), or wrote a "toggle Host on/off" feature into the software, it could work.

1113. Re: Genesis controllers for 8-bit?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-11 00:00:00 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <ZdEDwSf.lmcclure@delphi.com>
Source record: 90138

In a message dated 7-7-95, Ryan 'Gozar' Collins said :

"This is an idea I had a while back, when I first got a
Genesis controller and wanted to use the extra buttons
without modifying the controller itself (You never know,
I might get to use it on a Genesis some day!!) Anyway,
it would be nice to have some sort of standard on using
the extra buttons, so that a lot of people don't come up
with different ways of doing it."

There are basically two approaches.

The first would be a conversion box with fixed assignments for the extra buttons. The problem with this is that if they do not fit your needs, you're stuck.

The second approach would be to create a re-programmable box. In the least expensive form, this could take the form of a box you could open up and switch jumpers around to change button "programming". In the luxury version, an actual electronic switching circuit, perhaps controlled by a microprocessor could be used. The jumper-box version would be good for folks who stick with the same assignments (i.e., have one favorite game or application), while the luxury version would be good for those who wanted a different setup for the many games they have.

For any fast and furious games that require rather critically timed "fire button + direction" inputs to execute a certain move, those extra programmable buttons could be a godsend.

One item to keep in mind is that if anyone creates a device, it could also be marketed to Commodore 8-bit and Amiga owners. In fact, if it made no use of the POT lines, you could add in Atari ST owners and various other systems, as well.

BTW, I saw one Sega gamepad in WalMart for about $30 that appears to be reprogammable and has a small LCD screen. If this item were flexible enough in it's reprogammability, it might be able to accomplish most of everything I have mentioned by itself. It would, however, lack the ability to access the joystick lines of a second port, an option you mentioned you would like such a device to offer.

Frankly, if I had any decent amount of money for prototyping such a gadget, I would market it myself. After all, at least for the "jumper box" version, we aren't talking rocket sciences. Alas, my current and near-term financial outlook dictates this shall not be so.

1114. WANTED: Amdek Disk Drive

I will probably get this wrong, but the 1400XL or 1450XL<?> didn't have disk drives. The 1450XLD was modified so you could have two IBM style drives mounted side by side in the case facing foward just above the keyboard. I forgot the various other options that meant different model numbers, stuff like built in modem or speech chip.

leto2@gol1.gol.com (Peter Payne) writes:

>Ah, those were the days. Mule after school, or Miner 49er. God, I wish I
>could go back.

Heh, me too. I owe a lot to my old Atari 8bit. The first computer
I ever used, and it was a big factor in bringing me to a career in
the computer industry.

My 8bit is used primarily as a hobby now. I've taken it out of
storage earlier this spring, replaced my dying 1050, and got
it up and running.

Now I'm trying to complete games I had started several years ago but
never finished; I'm working my way through Ultima III and hope to
get a chance to try to complete Ultima IV (all I need to do is go to
the Abyss and get the Codex, if I remember correctly). Amazingly,
I've started putting more money into the 8bit here and there,
buying a few new software packages for it.

There is one store in my area that still specializes in old computers,
especially the Atari 800 series and C=64. Unfortunately, their
prices are quite high, but they have some stuff you can't find
anywhere else. They still have a stack of brand new never opened
XF 551 disk drives and 1010 program recorders (!) as well as quite
a few games and some controllers. Ah, the memories! ;-)

I'm currently diddling with a few games I had worked on several years
ago when I was in high school, but they had never been completed. One
is a role playing game that is actually quite close to completion.
If there is sufficient interest in new software for the 8bit, I'll
try to clean it up and release it. I've been playing with the idea of
writing another game, but I simply don't have time to invest in
stuff like this. Maybe this will change sometime.

/Kevin

1121. Professionally produced SIO2PC Devices?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-12 00:00:00 UTC
From: classics@en.com
Message-ID: <3u0sjp$91f@antares.en.com>
Source record: 90059

With writing my new sio2pc software, and making cables for a number of people, I have been looking into the cost of having pcb's and enclosures made for a professional run of sio2pc devices.

The cost is much more than I originally expected, and I would need around 30 pre-production order @ $30 (+ $3 shipping) each to make the project a reality, far more than I originally expected. This cost includes all parts, first batch PCB prototyping, shipping of parts, misc materials, etc.

The devices would be made as follows:

--

2 sided, plated-through professionally produced custom PCB produced by AP Circuits.

Harris ICL232 Device
74LS368 Chip
Both IC's socketed

DB-9 jack mounted on the PCB. A serial cable or gender changer would be used to hook it to your pc, allowing for any kind of serial port.

A 'last-on-the-chain' style 1/2 SIO cable extending from the other side of the enclosure. I asked around (thanks to everyone who helped out!) and the cost of using SIO jacks would increase the per-unit cost approx $8. ($4 for connectors, and $4 for pusing the board size up to the next proto level, also many more via's)

--

Of course everyone gets registered copy of my sio2pc software free ;)

If there is enough interested I will start a list of people willing to pre-order the devices, and once enough people are together I will collect the checks and produce the units.

So if your interested, please e-mail me! :)

Thanks

Steve

As I remember, the Host version is only about 400 bytes more than the slave version. So the slave just never gets that extra code. The remaining ~14K bytes is common between the two.

|> Again - anyone have any Action! GL code!? :)
|> I've got a new 800XL coming, so I can finally PLAY! :)

No such code exists. Chuck Steinman or I would have to write it for you, as we're the only two who understand it. How much do you pay programmers? :^)

I got my Atati 800XL w/1050 Disk Drive back in Christmas of '84 and the
drive was packaged with DOS 3.0. I found that it was quite incompatible
with DOS 2.0 (the standard DOS that all software was written with at the
time) and in 1985, I had heard of an offer from Atari to trade DOS 3.0
for the new 2.5 they had just made. All you had to do was send the
master disk of DOS 3.0 and they would send a DOS 2.5 disk with a skinny
manual. All told, I was stuck with DOS 3.0 for 6 months or so. Sorry
for being so long winded, but I hope this helps.

I need either the address of C&T or would like to purchase
these following titles:

Paradox - I never found this game except from C&T. It is a text
and graphix adventure like the first of the Ultima series,
back when the 8-bits still got respect. It plays well even as
primative as it is by today's standards. It was C&T disk #344.

8-Bit Graphix Maker - Was a program in the mold of Envision, but
PD. It was C&T disk #469.

Geneology - Just the thing to shake your family tree. It was one
of the disks that the Mormon Church distributed for a variety of
systems to trace one's roots. It was C&T disk #500.

Adventurer's Companion - A cheat sheet PD program for various popular
text adventures. I may never get the babble fish in my ear again
without it. It was C&T disk #681.

Aftermath - A rich and gothic look at a world following a
nuclear war. It may not be as likely today with no more Soviet
Union. It is C&T disk #371.

The programs I need cracking data are: Atari Planetarium, Movie
Maker from EA, and NATO Commander from Datasoft. Yes, I own the
original disks!

>for being so long winded, but I hope this helps.

I remember when DOS 3 came out with the 1050's, but everyone in my area hated it, so we made mods to DOS 2.0 to allow enhanced density with it. There was a proliferation of DOS 2.x's that were available on boards because people all over the country had the same idea.

Steve, I think you have the older 2 chip version of SIO2PC. You should look into the one chip version, I doubt if that would reduce your initial cost that much since from what I've heard initial set-up can run $500 for even a single board <with no parts grin>, but every penny counts.
BTW: I've also been looking into how much current an IBM serial port can supply. It may be possible to do the SIO2PC design a little bass ackwards. Something like a single chip 1488 or 1489 on the IBM side. These are a little cheaper & don't require all the caps. I won't have the time to look at that particular scheme for awhile, but it's something you may want to think about. It would get your parts count down to a single inexpensive chip with maybe a zener/cap/resistor for the power supply. Heck, you could buy a $10 serial card for a clone & just pick off the 8250's signal before they go through the voltage inversion.
Rick

This isn't as unreasonable as it first sounds. There's a limit (64 I believe) to the number of directories you can have on a DOS 2 disk. If you put 64 files of "25 words or less" on a disk, the whole disk would be filled-up anway, because there's no more room in the directory. Having 1K clusters makes the VTOC simpler, because each byte can represent an entire cluster, instead of using individual bits. It would also keep the disk less fragmented, because 8 sectors are guaranteed to be contiguous, instead of having the possibility of single sectors being scattered about. The drawback is that unused sectors need to be read sometimes, as in your 25 word example.

1138. Repost: console keys

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-12 00:00:00 UTC
From: bruck@brachot.jct.ac.il
Message-ID: <9507122057.AA03638@brachot.jct.ac.il>
Source record: 90153

Again, I've been suspecting that stuff I've posted locally doesn't actually get anywhere. Here's a repost through a US gateway..

Newsgroups: comp.sys.atari.8bit
Subject: My messy console keys

Ever since I got my upgraded Atari XE, I've had one major pain in the butt that's been pretty annoying/destructive/time-wasting.

My console keys are constantly being pressed. That is, not physically (detaching the keyboard doesn't make a difference), but just when peeking CONSOL (53279) I keep getting values that represent presses of buttons.

In the past it usually happened when I pressed a key. I kept wondering why pausing games made them restart. Since then I went through a phase in which the computer kept crashing because of a weak power supply (stock supplies aren't powerful enough for 1-Meg upgrades), which I cured by hooking it up to my PC supply. The console-key problems are now far worse.

When I just turn on my computer it's fine. I can start playing a game as usual. About 5-10 minutes after that, the game cuts, and I'm back to the title screen with some of the options flicking around (players 1/2 switching, start level easy/medium/hard etc).

After about two hours, actual console-key presses are not detectable at all. The most frequent reading is Option+Select, or just one of them (less often). Pressing Start yields a reading of Opt+Sel+Start, which isn't really usable in any programs. If I load Joust the player number 1/2 flicks about 40 times a second (indicating a press of Option) and the difficulty about each second (Select). The game never starts (Start doesn't seem to press itself), but pressing Start does pause the flicking because Start plus Option or Select is meaningless to Joust.

And the most frustrating thing about all this is that no one replied about this AT ALL during previous requests! Even direct E-mail, with the exception of Ben Poehland.

If ANYONE has ANY idea as to what's going on I'd be really interested!

Also, I can send it to a friend of mine, who's good at electronics but knows nothing about the Atari specifically. What pointers can I give him if I let him hack my machine apart?

And is there anyone not on this group I should address this to?
(I think I'll try sending copies of this to Bob Woolley and Bob Puff..
see if they can help.)

Thanks aLOt in advance!!!

1139. Repost: 1200xl PBI

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-12 00:00:00 UTC
From: bruck@brachot.jct.ac.il
Message-ID: <9507122056.AA03618@brachot.jct.ac.il>
Source record: 90154

I fear that the reason I haven't received any responses is a posting
problem.. So I'm trying this through the mail-to-news gateway.

Newsgroups: comp.sys.atari.8bit
Subject: PBI on 1200xl - easy way?

I've been told many times that adding a PBI to a 1200xl computer is
not easy, since wiring 50 wires into their correct places is messy
and quite prone to errors.

However, I've noticed that on the 130XE the PBI is actually composed
of the cartridge port, plus a small, 14-pin ECI port.

My Supra hard disk interface plugs into this, through an adapter
that converts the ECI+cart combo to an 800xl-like PBI connection.

If I add an ECI connector to my 1200xl by wiring those 14 pins, will
I be able to use my hard disk on it? Can anyone tell me how to do this?

Never mind the physical difficulties (the cartridge slot is in a deep
hole).. I can use a saw! It's the soldering iron I'm timid with.

Thanks,

-itay

It's been a long time since I got into this at all, but it sounds like your POKEY chip is going. Are you having any sound problems at all? The POKEY is used to read the keyboard as well as making sounds. It could be something as simple as a filter capacitor as well. It is probably not the keyboard itself, unless it shows up while you are using the keyboard. The XE's did have flaky keyboards and it might be worthwhile to put some foam (non-conductive) under the keyboard to support it since the built in supports are not strong enough. BTW, I've been following this newsgroup for a couple of months now and this is the first time I've seen this post.

>So...please: which MyDOS version should I use w/large drives?

If you are using 4.53 then that explains your problems with large drives,
MyDOS 4.53 is a user hack that uses a different kind of sector link, which
limits your drive size, as I recall. You definately need 4.50 (aka 4.54)
for large disks.

Itay,

I had the same problem with one of my 130XEs. The function keys started
geting all flakey. This is not untypical for some 130XE keyboards. The
fix for me was to lower the resistance values as stated above. I have got
the details if you want them. It will require the use of a low-voltage
soldering iron! :) But this fix usually does the trick and returns your
function keys to you!

I also put a non-conductive foam strip underneath the function keys for a
more positive contact.

Yes, Atari dropped support for *all* Atari computers, includeing the ST
series. But lucky us we have clone makers! C-Labs is making Falcon clones,
there is a somewhat new TOS compatable out called the Eagle, and there is
the TT compatable Medusa series...

I think for something like this we should trust James to put on the CD what he
can, but it would take a ridiculous number of hours (read months) to go
through and check 600+MB of files on a CD.

>I didn't think that 4.53 was a hack- I never read that anywhere else before!

It supposedly uses the same method for sector linking as DOS 2, so I guess
as big as DOS 2 disks can be. Which is only like 1000 sectors, correct?

I think I read that 4.53/4 was a hack from in here, possible by the person
who posted it.

I got my hands on some 64Kx4 DRAMs a while ago and have been meaning to upgrade my 600XL internally. I stuffed 'em in just to check for compatibility and the 600XL is quite happy with them. (Ok, I'm a dork, I've got a 1200XL kicking around with 256K DRAMs that I haven't upgraded yet either) Now I just need to know what I need to jumper to get the full 64K active. Are there instructions for this out there anywhere?

>Tell me more tell me more! Sorry about the blathering :) but it sounds
>like a good video chip! Where can I get more info???

They are great chips. Sega used chips from that series in their
original master console and in the Genesis. They are based on the TI
video chip in the TI/99, Colecovision, and MSX computers and were
originally developed by yamaha for MSX-II or MSX-III or somesuch. I
think the third party super TI/99 (don't remember the name, I just had
a friend who was a TI fanatic) which was pretty snazzy for its day
(back when Amigas and STs ruled the earth) used one from that series,
probably the same one as the Sega Master Console.

I've been trying (not too hard) to get data sheets and a good source
for these for a while now.

Does anybody know if they support external video through like the
original TI chips?

1161. Re: Repost: console keys

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-13 00:00:00 UTC
From: hans@macbeth.umd.edu
Message-ID: <3u43cg$r5a@macbeth.umd.edu>
Source record: 90083

On the 800XL the console keys are switches to ground, which connect
through 370 ohm resistors to pins 12, 13, and 14 of the GTIA.
(Presumably the GTIA has internal pullups). According to the SAMS
schematics the voltage at these pins should be 4.8 V when the
switches are open.
(I would guess that the 130XE is quite similar internally to the
800XL in this area).

Possibilities:
1. The keyboard has a short on these lines. In that case unplugging
it should make the problem go away.
2. The GTIA is fried. In that case the voltage at these pins will be
substantially lower, even with the keyboard disconnected. If that is
the case, it might be possible to fix this with external pullup
resistors (10k ohms or so). (You can make this measurement with
almost any reasonable voltmeter).
3. You are picking up noise from some wires having to do with your
memory upgrade. (This is the one I would bet my money on, based
on your symptoms). Unfortunately you would need a good oscilloscope
to detect this one. (on the 800XL the keyboard connector and the
GTIA are on opposite ends of the board, maximizing the possibility
for this).
If this is your problem, you can probably fix it by attaching
small capacitors (.1uF) to the traces feeding the GTIA inputs.

Happy hunting!

From: hans@macbeth.umd.edu
Message-ID: <3u44lo$rih@macbeth.umd.edu>
Source record: 90087

There are three signals on the 800XL which have to do with PBI memory management:
MPD/ An input which disables the floating point ROM. Used as input to the memory management PAL (MMU).
EXTENB Output from the MMU which enables the PBI memory addresses
EXTSEL/ Input from the PBI indicating that it is responding to memory request.

If the 1200XL has these signals, and their associated logic, already, then wiring the ECI is a simple matter of finding those 14 signals.

It would surprise me greatly, however, if Atari had built all that logic into the 1200XL.

A long time back I worked with the author of COMPUTEREYES
to make it work with SDX. In the process I tweaked it so it could use
Double Density, D1: thru D9:, BOOT and run from a Hard Disk and changed
the HELP routines to be accessable with the HELP KEY. I did the same to
a Printing program, BILLBOARD. Of course, it was all done in BASIC or
I would never have been able to do it. I'm a Hardware man, not a programer.

With the syptoms, what you're asking is pretty difficult to do
diagnose. I'll give it a shot.
After checking my 130XE Schematics, it appears that the
START, SELECT and OPTION function keyes are read by the GTIA
chip, pins 12, 13 and 14. What can I say, my O'Scope probes won't
reach you so try swapping it with a good one. Ah, carefull, it most
likely is soldered to the mother board. If you do pull it, I'd have a
GOOD 40 pin socket to put in its place.

Beta test version 8 of my sio2pc software will soon be available. I will
be uploading it to ftp.xmission.com later on.

Newest features include: pc-mirror (copy files and naviagate pc directories
using only mydos/spartados, no special
software required)

improved user interface
improved handling of syncronization errors
improved handling of poorly created disk images
improved disk image creation speed

and many new features, including direct file copies TO the pc drive
coming soon! If you download the software please talk a moment and
let me know what you think of it, ive invested alot of time into it and
feedback makes the effort seem justified :)

Thanks

1170. Other uses 4 Star Raiders Keypad?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-13 00:00:00 UTC
From: Nate Niceswanger <naten>
Message-ID: <3u45nt$riv@mcrware.microware.com>
Source record: 90092

Going thru my closet the other day, I ran across our keypad that we used to use for Star Raiders on the 2600. Hopefully most of you know what I'm talking about - it has 12 (16?) buttons on it and was used in addition to the regular joystick.
Does anybody know how, or if, I could go about implementing the keypad in a simple BASIC program on the 8-bit? I remember toying around with it a few years back. Some of the keys would give out codes like a normal joystick, but not all (unless not all of the buttons were working at the time). Is there another trick I can use here?

This video thing seems to come up every once in awhile. Last go around I think Jeff McWilliams went to the TI 99/4 group to get some info & found out a couple of people there had hacked the newer chips into their TIs. Mike has the info I found on the first generation chips after the 9918, & went to the trouble of phoning Yamaha, somewhere in Santa Clara County like San Jose, to get fresh info. IMO a major stumbling block for casual hacker use is they are pretty much those square surface mount Oereo looking things now. The older chips like the 9918 are still available from JDR. This was one of my most ambitious failures! I collected all the info I could on the 9918, TI data book & Circuit Cellar hack putting it in an Apple II, & promtly proceeded to find out I wasn't good enough to hang the chip on a 800XL expansion buss. Actually I didn't have the TI data book when I first started so I was probably doomed right there. If this has a point, it would be Circuit Cellar INC sold the circuit & a Logo was even written for the Apple thing, but who besides me has ever heard of it? Just so people don't think I raining on their parade, I think video hacks like this are the most interesting thing that can be done, just that it's an esoteric experience. For the 8 bit, it would end up being a smaller non-event then the Apple version. I wouldn't mind programming the thing myself, but then they don't make a SNES with a keyboard & Action.
Rick

I had one of those years ago.Had picked up the complete 2600 Star Raiders package for a couple of bucks, just because that controller looked interesting. I had no 2600 at the time,
so I eventually gave it away to someone who did. Shortly thereafter I got my first 2600 for $5 at a yard sale, and I never have run across another Star Raiders for it. Sigh.

Anyway, I can give you a few rough clues from memory. If you need more, I'll have to dig a bit. It's all in the original 400/800 Technical Reference Notes/manual. As I recall, it's the
only keypad described in there, it being written even before the CX80 was done. The deal is that the keypad made full use of the 8-bits of the joystick port. Can't remember if it just
binary-counted thru each key or did a 2x2 array designation by nybble. Anyhow, I think you can see all the codes if you PEEK the joystick port (can somebody help me with the location?). That is, don't use the STICK(n) function--if it doesn't see one of the 9 valid joy-
stick codes it doesn't do anything.

If this doesn't get you going, let me know. I do remember it was all very simple. The CX80 is
a whole other ball of wax--it takes a relatively fancy handling routine to read.

Yes, the POKEY reads MOST of the keyboard, but not the START,
SELECT and OPTION keys. Each has it's own signal from the key board
connector, J8 pins 20, 21 and 22. These three signals go to the GTIA chip,
pins 12, 13 and 14. A very few XE's had a problem that the Function keys
wouldn't work at all. The fix was to lower the resitance value of resistors,
R134, R135 and R136. These three resistors are in series with the Function
keys. I worked on and fixed 2 of these XE's long ago.
BTW, RESET is on connector J8, pin 23. J8 is the keyboard
connector.

I admit your problem is probably not this, since it seems heat-up related--
but it may be worth it to remember that the keyboards of XEs are notor-
ious for getting flakey. This involves the printed-circuit mylar sheet under
the keys getting dirty or the traces breaking. Usually, this would involve
the LOSS of use of a key, not its being read as continuously pressed--
but it may still be worth checking out the condition of the keyboard ribbon
connector, etc. as a first step. Next step might be to get a cooling fan.

1177. Software piracy, a second opinion

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-14 00:00:00 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1995Jul14.223111.22386@wariat.UUCP>
Source record: 90007

I'm presenting a 'second' opinion about possible commercial
software on the xmission site. I suppose this is mostly a
post to M. Current, but I want it to be public.
There was an arrest in the past year of some www site or
ftp site of a student at a university (excuse my lack of
specifics, fill us in if you know more.) The case against
the student was dismissed. The site had, I believe, lots of
commercial software, mostly PC type, again pardon the lack
of specifics. I don't know why the case was dismissed. My
point is, the putting up of commercial software on an ftp
site was not deemed illegal in this particular case. Mr.
King is himself a system administrator.
Commercial software for the 8-bit is often not available,
or it is available but in protected versions. There are
many people who own legitimate copies of ancient or newly
bought A8 software that would like to have a backup or
'image' capable copy. The commercial software I saw on
xmission was not current software, that is it is not the new
software from Poland or Mr. Gore or other recent software
developers. I guess it is not a voting matter, but I
appreciate the xmission ftp site, never downloaded from it.
I think M. Current is being incorrect in thinking Mr. King's
provider will substantially care about the ancient
commercial titles available on xmission. I do think the
hassle and expense will cost A LOT of people this site.
To me an example of software piracy is the recent arrest
of some orientals in Los Angeles with millions of dollars of
Microsoft titles, the latest versions with conterfeit
holographic logos. Anything that decreases the sales of
today's A8 retailers and discourages new development is also
costly to this A8 community. I would guess that American
Technavision, B&C, C&T and other retailers have seen an
INCREASE in sales from the interest and nostalgia produced
by PCxformer and the availability of 'imageable' copies.

If anyone has docs available for Spart-Dos, please post, or email to me. Sparta-Dos was the first Dos I ever used with a command line processor and I was real comfortable with it. Now the years have passed, and MSDOS, VMS and Unix and now when I try to use Sparta-Dos, all I seem to accomplish is writing a file on top of itself...0 bytes in this new file. 1.1, 2.3, 3.2 or whatever you have docs for would be appreciated. There was one text file that I thought would help, but guess what? Yup, 0 bytes after I tried to print it!

Yes, they do work with the 8-bit, but I haven't studied it too far.
(The joystick pretty much sucks!!!!) I did solder in a wire for
the right button to be the same fire button as the left. The big thing
I use the Colecovision joystick for is to replace the key I lost for
tenth frame on my ST. If I hold down the 0 button while the game is
booting, I can get past the copy protection.

Source record: 90099

Yes Mail Order Monsters was released for the Atari 8-bits on disk format, possibly by Electronic Arts (I can't remember exactly so don't hold me to that!).

Was it any good? Well I don't know how it compared to the C64 version but the graphics are a bit simple during most of the actual action, but there does seem to be a large scope for parameter alterations. Personally I never liked it much, I'm a shoot em up fan, but at least I hope I've answered your question! As to where you can get it these days, I don't know, check out the latest AC there are several companies in there with pages and pages of software, its probably there somewhere!

Richard Gore
chmrig@leeds.ac.uk

PS I've not heard any net-talk about this new AC, the one with the return of the Alchemist talking about Percom drives. I assume from this silence that either people haven't got their copies yet or they are happy with it!

Source record: 90013

Hello everybody!

I just picked up my first 1200XL and an XF551 for $30 at
a thrift store, and now I'm trying to remember all the talk about the
problems in the 1200XL OS when it first came out. Can somebody sum up the
differences between the 1200XL and the 800XL besides the obvious (no
BASIC, better keyboard, etc.)? Does the 1200XL have the chroma signal on
the monitor jack (unlike the 800XL)? Do I really need to be concerned
about compatibility, since I have an 800XL I can play games on and this is
mainly going to be my coding machine (thanks to the killer keyboard)?

Also, the XF551 came with a DOS 2.5 disk and a manual that only mentions
enhanced density and 1050 compatibility, but the FAQ says the drive is
DS/DD. What's the deal?

TIA,

Heck, I think with a price like $15 and set it up for some popular file indexs
(like for PC boards) and I bet many bulletin board operators would buy a CD
like this just to support some of their Atari 8-bit users, or maybe just
because they love their 8-bit.

Your in vancouver BC? Whoa! Your one of THE FEW 8-bitters left in the lower mainland! I only know of 2 others (now 3) people that are still active! But then again, there is a fairly active group over on Vancouver island, they even have their own BBS running on an 8-bit, with like 500Megs with Swapped partitions on a blackbox... ANYWAYS

There are no stores around that specifically sell atari 8-bit software.. The only atari store left is Falcon Systems in Burnaby, and they are ST/Falcon, and now a little PC... My best bet would be to look around the second hand stores and the like, I have been too a few and there is usually a few 8-bits, and maybe software to go along with it :)

Maybe we could trade? I have a bunch of original carts... and a few tape games, including preppie 1 and 2 that I got at a swap meet for 50 cents each! I also got about 5 Synapse games on tape, like Pharoahs curse, shadow world, etc.. (but i want to keep those! im collecting them..)

Anyways, my email address is rgoolevi@cln.etc.bc.ca and you can email me if you want!

: about compatibility, since I have an 800XL I can play games on and this is
: mainly going to be my coding machine (thanks to the killer keyboard)?

The biggest difference to me between the 1200XL and the 800XL is the fact that the 800XL OS has the necessary code in it for the PBI (Peripheral Bus Interface whereas the 1200XL does not. But then again, the 1200XL does not even have a PBI! It can be hacked, however.

The 1200XL does have the chroma signal at the monitor jack, unlike the 800XL. However the stock 1200XL video (both the chroma and the luma) is easily the worst of the Atari 8-bit lot. However, with the SuperVideo 2.1 upgrade from the December 1993 issue Atari Classics it becomes the best of the lot! Why? Because the 1200XL has some additional color saturation circuitry which makes it really stand out with a good split video monitor.

As far as compatibility... I am still running my 1200XL with the stock 1200XL OS and have not run into any compatibility problems except for software which accesses the PBI code. There may be a couple of programs which are not compatible.

: Also, the XF551 came with a DOS 2.5 disk and a manual that only mentions
: enhanced density and 1050 compatibility, but the FAQ says the drive is
: DS/DD. What's the deal?

The XF551 is definitely capable of true DS/DD 360K. It has two heads. But DOS 2.5 cannot access. Try MyDos 4.53/4.54, SpartaDos 3.2d/f/g, SpartaDos X cartridge, or DOS XE plus others. They can format the XF551 as true DS/DD. You can even upgrade the XF551 to a 3.5 720K drive system!

I will let the other real Atari 8-bit experts add in their commentary...

Tom

Well, my addtions are almost on the level of trivia. As you noticed, you have to use a basic cart unless you're willing to hack the computer. It's not a real problem to add a 800XL OS, but unless you're looking to do some real serious stuff, it isn't necessary. The only problems you will run into with carts are the Sparta DOS X & the Proburner, these have trouble fitting. Fomr a game cartridge standpoint, I thing the only problems for sure are GORF & Escape from Eypix<SP?> 4. These are both made by ROMAX & I think there may be some problems with some of the other ROMAX, or is it ROMAX, titles like Demon Attack. BTW: Do you have the 1200XL version that has the names of the development team on the screen when you boot it without a cartridge?

Tom! :) You're lucky - that you have had little problems running stuff with the 1200XL OS. I got so sick of programs crashing left and right (mainly demos and games from Europe) that I got a spiffy replacement from Bob Woolley, as well as a nice 256K RAM upgrade. Then it died though. I'm not sure if it's my fault, the SIO2PC cable I was using's fault, my VCR's fault (bad ground, RIck Cortese says), my 1200XL's brick's fault, or just my PC's fault by doing something mean to the SIO2PC cable. :(

Anyway.. but again, you're luck about the 1200XL OS running most of the stuff you've tried.. :)

Howdy Ward

There is no such thing as a stupid question!

Most of the cartridges for the 800 should work on XL/XE series computers.
But, I guess quite a lot of them require more then 16kByte (600XL's came
with only 16kBytes of memory)

(and there also are a couple of cartridges that will ONLY run on the XL/XE
series)

From: mathniss@link.xs4all.nl
Message-ID: <3u96aa$237@link.xs4all.nl>
Source record: 90040

Howdy All

Here's a list of things I don't like about PabQWK.
(I'll have a look at the *.NDX structure PabQWK uses soon.)

Maybe James King can use them, should he try to improve PabQWK.

BTW James, is your BBS still running.

The list:
- If you don't have a mail package (e.g. read them all, then deleted them),
you can not prepare a message.

- The name/address of the person you're addressing the message to, always has
to be entered in capitals. (Unless you're replying to a message, in which
case (no pun intended) it doesn't matter is the name/address is in caps or
lower case characters.

- I'd like 80 column support.

- After leaving PabQWK (using Q), the first DOS command always returns an
ERROR 129

- If you want to use FILE TO MESSAGE, the device name should be in capitals.

- I sometimes get an empty window where TAG, SAVE, CARBON COPY, ABORT should
be. Don't know why.

- It would be nice if PabQWK had a feature, where it would load our names or
signatures from a small textfile.

That's it for now.

Mathy, I would think the ONLY advantages PAL users would gain with an NTSC upgrade(!) would be:

(1) As you said, NTSC GEN Lock hardware would work
(2) VBI-driven screen enhancements would look better (flicker would be at 60fps not 50fps). ColorView modes, APAC modes, Flick-80, UltraColor IRG, etc. would look nicer.

Summary of Atari 8-bit's an emulated 8-bit Atari's:

Atari 8-bit computers were produced between 1979 and 1987. The
major models released were the:

400 - 8K-16K, 400/800 OS, CTIA or GTIA graphics (depends when made)
800 - 8K-16K-48K, 400/800 OS, CTIA or GTIA graphics (depends when made)
1200XL - 64K, 1200XL OS, GTIA graphics
```

600XL - 16K, XL OS, GTIA graphics
800XL - 64K, XL OS, GTIA graphics
65XE - 64K, XL OS, GTIA graphics
130XE - 128K, XL OS, GTIA graphics
XEGS (Game System) - 64K, XEGS OS, GTIA graphics (Had Missile Command)

All of the XL's except the 1200XL had BASIC installed on ROM. BASIC can be purchased on cartridge for the 400/800/1200XL's.

Branch Always Software are the creators of:
ST Xformer (Atari 8-bit emulator for ST's), Quick ST, Quick Index, Gemulator (Atari ST emulator for PC's), and PC Xformer (Atari 8-bit emulator for PC's).

ST Xformer 2.0 and 2.5 released for the Atari ST 16-bit machines. Very limited. Now public domain (used to be commercial).
PC Xformer 2.0 and 2.5 released for IBM PC machines. 2.0 is limited and supports only 800 OS. Both public domain (were always PD).
PC Xformer 3.0 released for IBM PC machines. Supports all OSes, 320K RAM, and best of all, player/missile collision detection (which MANY games use!)

Graphics:

The Atari has maximum resolution of 320 x 192 (standard, non-overscanned screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4, 160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also supported. 40 x 24 x 256-character (128 normal, 128 inverse, character set indirection available) text mode is standard (2 colors).
40 x 24 x 128-multi-colored-character (4 colors per character allowed, the other 128 characters have 4th changed into a color 5) and 40 x 12 x 128-multi-colored-character screen modes are available.
GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only, and 80 x 192 x 9 color screen modes.
Normal (bordered), narrow (underscanned), and wide (overscanned) screen modes are available.
Screen modes can be mixed (by lines) down the screen using the Display List (a program which is executed by the ANTIC graphics chip every screen refresh (60 times per second on real NTSC Ataris).
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.
All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via a "Display List Interrupt."
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection (which is not supported by the PC Xformer 2.0 and 2.5 and ST Xformer programs).

Sound:

Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4)
can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only
modes can be enabled for digitally sampled sound replay.
A fifth "voice" is produced by the internal speaker on Atari 400/800's
(for keyclick and buzzer) and in the XL's and XE's this was
(fortunately!) rerouted through the normal audio output, and the
keyclick can be disabled.

Objective of this file:

At the time of its release (mid 1994), much discussion went on in the
comp.sys.atari.8bit Usenet newsgroup about the Atari 8bit emulator for
IBM / MSDOS based computers, the PC Xformer 2.0 (XF2 for short). Many
people in the 8-bit community had gotten, well, fed up with the XF2-based
questions which did not pertain to them, or to the really dumb questions
which were in fact understandable to new or rusty Atari 8-bit users, but
had just gotten on the nerves of some of the comp.sys.atari.8bit
readers/digest subscribers.
This file was created to reduce the number of 'newbie' and XF2
questions. Now it's becoming a fairly good reference (and got me the job
of writing the commerical 3.0 release's documents!).
This FAQ will present answers to simple questions like "how do I turn
off BASIC" (a good answer to that of course is, READ THE FRIGGIN' MANUAL)
and "how do I get a disk directory?" (which is less obvious on
Atari 8-bits, err.. MOST 8-bits <grin>).
It will also direct people who are unaware of the large amount of Atari
8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps become a
supplement for the many official and unofficial files floating around the
net (like the official FAQ, the Vendor/Developer List, the Who's Who list,
etc.).
Since revision 0.4 of this file, PC Xformer 2.5, a replacement for 2.0,
and 3.0, the first commercial release, have been released. It is assumed
that the reader has the latest versions of PC Xformer (2.5 or 3.0), although
if you have 3.0, I must say, those documents are great! (If you don't get
the joke, look at the name of the author of the manual, and look at my name.)

---=== Xformer Questions: ===---

Q.1) What does "READY" mean?
A.1) This is the Atari BASIC prompt. See below for hints on Atari BASIC.

Q.2) Why doesn't this program load?
A.2.1) The program may not work under the Atari 800 Operating System, it may
require the XL/XE Operating System. Be sure you're in 800XL or 130XE
mode. (130XE mode is only supported by XF3.0, not 2.5, but there is
no real difference in the operating systems.)
A.2.2) It may not work under the XL/XE Operating System (rare cases), switch
to 800 mode.
A.2.3) Be sure you turned BASIC off before trying to load it if it cannot
run with BASIC on.

A.2.4) It might be a BASIC game! Be sure you're in BASIC and use the BASIC
"RUN" or "LOAD" (and then "RUN") command. Also, be sure it works
with the BASIC you have. Some programs only run in BASIC XL or XE
(which are both cartridge-based BASIC's not currently supported by
the Xformer), and some run with TurboBASIC XL (disk-based).
A.2.5) It may just refuse to run on the emulator.

Q.3) How do I turn off BASIC?
A.3) To toggle BASIC on and off, press [SHIFT]-[F10] ([F10] is [RESET], note:
on a real Atari 8-bit, [SHIFT]-[RESET] does not have this effect).

Q.4) Why doesn't this game/program run correctly?
A.4.1) It may use player/missle collision detection which is not supported
on the XF2.5. You might have to shell out the $29.95 for 3.0!
A.4.2) (See Question 2).

Q.5) How do I exit XF and return to DOS?
A.5) Press [F5]. Note: this does NOT temporarily 'shell' or 'jump' to MSDOS.

Q.6) How do I get to Atari DOS?
A.6.1) In BASIC, type "DOS" at the "READY" prompt.
A.6.2) Reboot without BASIC on.
A.6.3) Be sure you have a DOS-bootable disk image as the first MSDOS
parameter after the "XFORMER" command. (DOS25.XFD and MYDOS45.ATR
are both DOS boot-disk-images and are both in the XF25.ZIP file or
on your XF3 disk).

Q.7) How do I use MSDOS files with XFormer?
A.7.1) Add the files to the command line and use them as their respective
drives (be sure the first drive is a DOS-bootable disk image).
Example: XFORMER MYDOS45.ATR filename.ext
When booted the Atari will have two drives, D1: will be the MyDOS
4.50 disk image and D2: will be a write-protected disk which contains
only the file "filename.ext". Note: there are bugs in XFormer which
make accessing files from different directories a bit hard, just use
the MOVE (or COPY and DEL) commands in MSDOS to get the file to the
directory where you call XFORMER from.
A.7.2) Use the MSDOS program S2PC (S2PC.ARC available in the Utilities
directory at the UMICH archives) which allows you to access files
within a MyDOS/compatible .ATR disk image without using an SIO2PC
or the XFormer. S2PC let's you read, write, delete, change directory,
and view the directory of a MyDOS/compatible .ATR disk image. It
can be used via command-line parameters from MSDOS, or as a menu.
A.7.3) If you can, use the MSDOS program ATARIMG, which is much like
S2PC but has a nicer, more graphical (less-menu driven) interface.
(Unfortunately, this doesn't run on all IBM's!)

Q.8) Just what ARE .ATR and .XFD files?
A.8.1) Refer to the XFormer and SIO2PC manuals for details on these files.
A.8.2) Simply put, they are Atari disks, stored as files which are as big
as the disk they represent (an 88k disk image will use 88k on the
IBM). .ATR files are used by SIO2PC (see below) as well as the

XFormer (and the S2PC program mentioned above). .XFD files are used
by ST Xformer (the Atari 8-bit emulator for Atari ST's) and PC
Xformer (XF2,XF25,XF3).

Q.9) What's SIO2PC?
A.9.1) Refer to the XFormer and SIO2PC manuals for details on this program.
A.9.2) This is a program which runs on IBM/compatibles which, with the use
of a simple (and relatively inexpensive) cable, makes the IBM act
as though it were an Atari disk drive. (Up to four drives, actually).
It uses disk image files (.ATR's) and can also let the Atari access
single IBM files (much like XFormer does) as a single file all alone
in its own disk. It also currently allows Print-Thru (all access to
the Atari "P:" (printer) device can be redirected to the IBM's printer,
screen, or MSDOS file; different translations/conversions are
user-defined when the Print-Thru mode is turned on). Finally, with
the use of two programs on the Atari 8-bit (the only two programs
that currently have anything to do with SIO2PC that have been written
(to my knowledge) for the Atari 8-bit), the IBM can be controlled
remotely (commands are sent from the Atari, typing on the IBM is not
necessary) and files can be sent directly to the IBM's drives.

Note: The following sections will simply discuss Atari BASIC, the Atari OS,
and Atari DOS 2.5 and MyDOS 4.5x (because these topics seem the most
relevant to the less-knowledged/experienced XFormer users).

---=== Getting around on the Atari: DOS and OS ===---
I. AtariDOS and MyDOS QuickReference:

MyDOS (4.50 and 4.53) presents the user with the following commands:

[*] Disk directory of current directory (like "dir *.*" in MSDOS)
[1]-[9] Disk directory of a disk drive (like "dir a:*.*" - "dir i:*.*")
[A] Disk directory (like "dir <mask>" and optional output destination)
[B] Quit to cartridge
[C] Copy file(s) ("<source>,<destination>" copies from one place or
disk to another, just "<source>" copies from one place on one disk
in a drive to the same place on another disk in the same drive
(asks for swapping))
[D] Delete file(s) (add "/N" to delete without being prompted first)
(add ">*.*" or ":*.*" after a subdirectory name to delete the
files within it. A subdirectory name alone will delete the
subdirectory (if it is empty and unlocked)). (Acts like both
"del" and "rd" in MSDOS.)
[E] Rename file(s) (renaming multiple files is allowed, but be careful).
(like "ren <old> <new>" in MSDOS - with MyDOS, use "," between
old and new masks.)
[F] Locks file(s) from overwrite, deletion and appending (like
"attrib +r <mask>" in MSDOS.)
[G] Unlocks file(s) (returns them to their default state).
[H] Writes DOS files to a disk (this creates a disk which boots with
the current version of MyDOS you are using and also has the menu
file "DUP.SYS" on it as well). (This is like "sys"(?) in MSDOS.)

[I] Formats a disk (add "/N" after the drive number to do a quick-format
of an already-formatted disk (ie, just a very fast delete "*.*").
[J] Duplicate disk (copies an entire disk, including boot sector,
when using XFormer, it's much quicker to just copy one .XFD or .ATR
to another).
[K] Make binary file: saves memory and makes it binary-loadable. See [L].
[L] Load binary file: loads a compiled program. (like "<filename>" in
MSDOS, except any ".EXE", ".COM", ".OBJ", etc. is still required.)
[M] Run at address. Mainly for advanced users. Reboot is "E477",
reset is "E474" (these are the hex values of the addresses where
the routines to reboot and reset are.)
[N] MEM.SAV: when this is on, whenever you go to DOS (from BASIC,
for example) it will write what is in memory to a file "MEM.SAV"
so that when DUP.SYS (the menu) loads it isn't lost forever.
When you exit DUP.SYS with the "B: Run Cartridge" command, MEM.SAV
is reloaded and the environment should be as it was when you left.
It's probably quicker to simply "SAVE" your programs (if in a
language) which aren't nearly as big as all of the memory that
MEM.SAV saves.
[O] Options: this presents the user with some options. Mainly for
advanced users or special setups. See the MyDOS docs for details.
[P] Set density. Forces a drive to be recognized at a certain density
if MyDOS can't figure it out. (??)
[Q] Make a subdirectory. (like "md" or "mkdir" in MSDOS).
[R] Set default directory. (like "cd" in MSDOS and "cwd" in SpartaDOS)
This makes "D:" now the same as a subdirectory or other drive.
ie, "D2:" will make all calls to "D:" act as though they are to
"D2:" instead. Some programs when prompting for filenames do not
add "D:" to the beginning if one is not present, they add "D1:".
If you don't trust a program to look to "D:" instead of "D1:" and
you want it to look to some place OTHER than "D1:" (ie, where "D:"
is pointing which could be a VERY long path list), just add "D:"
to the beginning. ALSO, some programs don't even ADD "D:"'s if they
aren't in the filenames you give and may give errors (138, for
example: device not present, ie, if you said "TESTFILE.DAT" it
may think you want "T:" instead of "D:TESTFILE.DAT").
[S] Set ramdisk number. This is also under [O]ptions.
[V] Verify writes. This is also under [O]ptions. When Verify is on,
writes will be slower but 100% reliable. With it off, writes will
be much faster but possibly not as reliable (on bad disks, for
example). Default is off.

AtariDOS presents the user with the following commands which are identical
to MyDOS's commands: A,B,C(no swaping),D,E,F,G,H,I(some densities),J,K,L,M,N

AtariDOS 2.5 presents the user with the following commands not present or
not the same as MyDOS's commands:
[O] Duplicate file. This is used to copy a file from one disk to another
using only one drive. (In MyDOS, giving just a source will make
[C]opy act like DOS 2's Duplicate.)
[P] Format Single. In DOS 2.5, this is used to format 88k (Single Density)

disks. To format an Enhanced Density (127k) disk, just use [I].
In DOS 2.0, [I] is the only format option and only handles 88k.
(I may be wrong, but I have never had a Double Density drive under
Atari DOS 2.0 or 2.5!)

II. General DOS and OS questions:

Q.1) How do I access the disk drives?
A.1) First, you need to have booted with a DOS. All but one DOS is on
disk (SpartaDOS X is on cartridge). When the Atari boots up, it
does some of its 'boot-up stuff' which includes looking for a
disk drive connected and turned on which is set up as drive #1.
It then begins to load from the disk's "boot sector". If none
exists or there's a nasty error on the disk, you get the
"BOOT ERROR" notice until the error is fixed. (On SpartaDOS disks,
even non-bootable disks have a boot sector, but all the boot
sector is is a small program which displays a 'not a boot disk'
error).
To end the digression, the answer to 'how do I access the disk
drives' starts with 'you must boot the Atari with a DOS'. Check
the 8-bit FAQ and the UMICH and other FTP archives for lists of
DOSes available for Ataris, but the most used are Atari DOS (for
compatibility with almost ALL older software), MyDOS (for an
Atari DOS compatible high-end DOS), and SpartaDOS (for a very
high-end DOS which looks much like MS-DOS but unfortunately
cannont run all software which runs fine with Atari DOS and
MyDOS.) Note: SpartaDOS does NOT run on Atari 400's and 800's
(except the cartridge versions and I believe disk version 1.1).
Now that you have a DOS loaded, the Atari understands the
"D:" device (see below for Atari devices). Since there is more
than one disk drive, you have to be able to tell them apart.
The Atari uses numbers when it has more than one of the same
device, so "D1:" is drive 1, "D2:" is drive 2, "D3:" is drive 3,
etc.!
After the "D:" device name comes the filename. Of the most used
DOSes, only MyDOS supports lowercase letters in filenames, but
since most programs force uppercase entry for filenames, nobody
really seems to use lowercase in their filenames.

Q.2) How do I copy things from one place to another?
A.2) Atari DOS and MyDOS give you the "C" command in their menu
interface. When it asks for a source and destination, you can
use wildcards (* and ? like in most other DOSes) to copy more
than one file at a time. You can also present no destination
so that a file can be copied from one disk in drive 1 to another
disk in drive 1, for example, and the DOS will ask you to insert
each disk.

Q.3) What are subdirectories?
A.3) Subdirectories are places where files go which are just like the
normal directory of a disk, except the they happen to be WITHIN

that normal directory, or even another subdirectory. For example, you can have your disk divided up into the "GAMES" files, the "GRAPHICS" files and the "SOUNDS" files. A directory of the disk (the "root" or "base" or "trunk" directory) will simply list the three subdirectories, "GAMES", "GRAPHICS" and "SOUNDS". Then, if you ask for a directory listing of the "GAMES" subdirectory, you will see the files (and perhaps other subdirectories) within the "GAMES" directory. Think of it as a tree. For people familiar with Macintoshes, "Folders" are simply subdirectories. A window which appears when you open a "Disk" Icon is the "root", and all of the "Folders" within it have more windows in them which also have file and folder icons.
Here's a comparison to using subdirectories on different DOSes
root 'GAMES' 'SPACE' within 'GAMES'
AtariDOS D: n/a n/a
MyDOS D: D:GAMES: D:GAMES:SPACE:
SpartaDOS D: D:GAMES> D:GAMES>SPACE>
MSDOS (IBM) \ \GAMES\ \GAMES\SPACE\
Note, only Atari DOS would be using drive 1 here, all other DOSes are not necessarily using drive 1, and MyDOS and SpartaDOS may already 'be within' a subdirectory.
In MyDOS and SpartaDOS (and MSDOS), you can change the 'current' or 'default' directory to a different place (a different drive or a subdirectory). "D:" can stand for "D1:" (like AtariDOS always does) or "D2:GAMES:SPACE:"! PLEASE READ THE MYDOS DOCUMENTS FOR DETAILS ON THIS!

Q.4) What does "P:", "E:", "K:", etc. mean?
A.4) As stated before, the Atari has devices. "D:" is added when a bootable disk in drive 1 is read. Other exist as well:
C: cassette - readable and writeable, no filenames
D: disk drive - readable, writeable, random access, directory, files, multiple devices (up to 9 on MyDOS and newer SpartaDOS, 8 on AtariDOS)
E: editior - readable, writeable. This is how input from the keyboard and output to the screen is normally handled. If you wish to type a small file up by hand and have it sent to the printer or a file, use "E:" as the source.
G: graphics - writeable. This is not built into the Operating System but must be loaded. This is an Epson-compatible printer driver which can easily dump graphics.
K: keyboard - readable. This is just the keyboard. Input from it is not 'echoed' back like with the "E:ditor".
M: multi-mouse - readable, writeable? This is not built into the Operating System but must be loaded. This is a handler which runs in the background and accepts input from either a mouse, a joystick or a touch-tablet and displays a mouse pointer on the screen.
P: printer - writeable. Send data to this and it will appear on the printer. You can print files (documents, etc.) by

using "P:" as the destination. The Atari XL/XE OSes support
"P1:" and "P2:", although I believe this usage is rare.
R: RS232 - readable, writeable, concurrent mode. This is not
built in to the Operating System, but is loaded. It supports
modems. The Atari 850 Interface has it's "R: handler"
'built-in', which means the Atari also looks for an 850 (or
other compatible interface) and receives the "R: handler" code
from it. Other interfaces and the Atari 'direct-connect'
modems require a file to be loaded which contains the "R:"
code. "R1:" and "R2:" is also supported, but also its usage
seems rare.
W: Windowing (screens) - readable, writeable. This is a graphics
8 graphical windowing driver (rarely used, unfortunately!).
It must of course be loaded as well.
Z: RTime8 clock - readable, writeable. This is also not built
in to the OS, but loaded. This is loaded from disk and lets
the user access the "RTime8" real time, battery-backed up clock
for the Atari 8-bit. (This is a cartridge-based device).
I am unaware of any "Z:" clone which let's you set the Atari
internal (non-real time, non-battery-backed-up) clock if you
do not have an RTime8, although I'd love to see one! <hint!!>

Q.5) How do I print something from DOS?
A.6) As stated above, just use the "C"opy command, then use the file
you wish to print as the 'source', and "P:" as the 'destination'.
Example: "D1:DOCUMENT.TXT,P:"

---=== Getting around on the Atari: BASIC ===---

Q.1) What does "READY" mean?
A.1) Again, this is simply the prompt that Atari BASIC (and most older
BASIC's) presents the user when it is in "Immediate" mode.
Entering a command will cause it to act immediately.
Entering a line number and then a command will place that line into
the current program.
Entering a line number alone will remove that line from the current
program.
To start a program, use the "RUN" command.
To erase a program, use the "NEW" command.
To clear variables, strings and arrays, use the "CLR" command.
To load a program, use the "LOAD" command followed by a filename
(see below). To load and run a program, use the "RUN" command followed
by a filename.
To save a program, use the "SAVE" command followed by a filename.
To list a program, use the "LIST" command followed by an optional
start and end set of lines seperated by commas.

Q.2) Where can I learn Atari BASIC?
A.2) A (set of) file(s) will be created explaining all of Atari (and Turbo)
BASIC's commands and their usage. (A larger file may be produced
which will be based on examples provided in the Atari BASIC Reference

Manual). (As of Jan. 7, 1995, these particular files do not exist).

Q.3) How do I quit BASIC?
A.3.1) Type "DOS" to quit BASIC and return to DOS.
A.3.2) Type "BYE" to quit BASIC and exit to the OS's "bye" routines
(Atari Memo Pad on 400/800's, Atari Rainbow on 1200XL's, and
Self Test on other XL's and XE's). (Note: On 1200XL's, use [HELP]
to go to the Self Test when the Atari Rainbow appears).
A.3.3) For XFormer users, remember, [SHIFT]+[F10] reboots and toggles BASIC.

Q.4) Why don't strings work?
A.4) Strings must be "dimensioned" like arrays in Atari BASIC. Strings
are special character arrays. See the BASIC usage/etc. files mentioned
in the answer to question 2. Simply put, to make a string that will
accept up to "#" character, use DIM <name>$(#) . Example:
DIM A$(10) - now A$ can contain between 0 and 10 characters.

Q.5) How do I make graphics?
A.5) Use the "GRAPHICS" command to switch between the following screen modes:
(Note: All modes except 0, 9, 10 and 11 have four lines of 40 x 24 x 2
sized text covering the bottom of the screen. Add "16" to the mode
number to remove this window (but do not make any PRINTs or PUTs to
the standard output otherwise a GRAPHICS 0 screen will appear))
(Note: Add "32" to the mode number to keep the screen from clearing
when it appears. One problem, however, all screens overlay each other
so unless you only use certain modes at certain times, parts of some
screens will become (or start out) with 'garbage' on them.)
0 40 x 24 x 2 text
1 20 x 24 x 5 text
2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 4 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Commands available in Atari BASIC for manipulating simple graphics
include:
PLOT x,y POSITION x,y COLOR c (c=color or character value)
DRAWTO x,y LOCATE x,y,r (where r is where result will be stored)
SETCOLOR c,h,l (c=palette location, h=hue, l=lum)
Colors:
COLOR command colors are not identical to SETCOLOR command colors:
COLOR 0 will draw using the background color, set with

SETCOLOR 4,hue,lum
COLOR 1 will draw using color "0", set with
SETCOLOR 0,hue,lum
COLOR 2 will draw using color "1", set with
SETCOLOR 1,hue,lum
COLOR 3 will draw using color "2", set with
SETCOLOR 2,hue,lum
Except in GRAPHICS mode 10, where COLORs 0, 1, 2, and 3 must be
POKEd into memory locations 704, 705, 706 and 707 (the
player/missle graphics color locations). Examples of this will
be presented in the BASIC usage files. (Sorry)

Q.6) How do I make sound on the Atari
A.6) Remember, XFormer 2.5 doesn't support sound! (XF3.0 does)
But anyway, in Atari BASIC:
SOUND c,p,d,v
c=channel (0-3)
p=pitch (0-255)
d=distortion (0,2,4,6,8,10,12 or 14)
v=volume (0-15)
The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT [CONTROL]+[G])

Q.7) How do I move the cursor and edit?
A.7) The Atari "E:" device (standard input/output which is the "editor")
allows the following characters for editing:

Key: AtASCII #: Use:
Atari none Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle] none Turn inverse on/off (Atari XL/XE kybds)
CAPS none Turns caps-mode to lowercase (400/800 OS)
CAPS none Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS none Turns caps-mode to uppercase (all OSes)
Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line
Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right
ClearScn ([^<]) 125 Clears screen
Bell ([^2]) 253 Sounds buzzer
TAB 127 Moves cursor to next TABstop
ClrTAB ([^TAB]) 158 Clears any TABstop under cursor
SetTAB ([ShTAB]) 159 Sets a TABstop under cursor
ESC 27 Sets ESCape (next edit char after is shown,
not done, non-edit chars shown (like normal))
RETURN 155 Sends End Of Line (moves cursor to lowerleft

of next line, accepts input)
Note: Inverse characters have values of the normal version of the characters plus 128. (The only non-viewable inverse character is inverse-ESC, or what would be the [ESC],[RETURN] combination. The character exists, but must be set into screen RAM by hand. Oh well, at least you still have 255 easily viewable characters! <grin>)

Q.8) How do I make the editor characters appear
A.8.1) As shown above, you must have an ESC sent before them. When simply entering text, type [ESC] then the edit key and the character for that edit key should appear.
When entering text in a PRINT statement, you must have it send an ESC beforehand, so first type [ESC],[ESC] to make an ESCape character appear, then type [ESC] then the edit key and the character for that edit key should appear. When the PRINT statement is executed, the first ESCape (which you typed as two [ESC]'s) will make the editor SHOW the following character (even if it is an edit character), then the character which you entered (with [ESC] and then the edit key) will make that character appear. This makes it difficult to align a set of PRINT statements which make a multi-line picture or menu which uses viewed edit keys. It is probably best to have all of the lines in your program with the PRINT statements that can fit visible on the screen, then edit them (without putting any of the ESCape characters in, then when the picture looks like how you want it on the screen, move the cursor to on top of each edit-key character and press [Control]+[>] (Control-Insert). A blank space should appear under the cursor and the rest of the line should move right. Now, type [ESC],[ESC] and an ESCape edit-key character should appear where the blank space was. When you are finished doing that for each line with those PRINTs in it, BE SURE TO ENTER THEM INTO THE PROGRAM BY PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!
A.8.2) Set the memory location "766" to "1" with the command "POKE 766,1" to turn on the no-edit mode (ALL characters except End Of Lines will appear, even ClearScreens!) When you want to go back into normal mode, set the location back to "0" with "POKE 766,0".

Q.9) What's with the colors changing?
A.9) THIS, MY FRIEND, IS THE FIRST EVER SCREEN SAVER! This is called "Attract mode" as was used on the Atari 2600 and Atari 400/800/XL/XE series (and probably on the 5200 and 7800 but I cannot confirm this). When a key hasn't been pressed for 7 or 9 (depending on OS, model, etc) minutes, the screen colors begin changing, thus protecting your TV or monitor from having a static image burned on it.
To turn this mode off, press a key, or, if within a program, use the command "POKE 77,0" at least once every few minutes (IF the screen is active, otherwise turning it off would be kinda useless).
To turn it on, wait 7 or 9 minutes without pressing a key or having location "77" set to "0", or set location "77" to "128" with "POKE 77,128", voila! instant attract mode!

Q.10) How do I access 'devices' on the Atari?
A.10) The following commands are available to Atari BASIC's (and also
variations on these are available in most other Atari languages!):
OPEN #a,b,c,d$ Opens channel 'a' for access to 'd$' in mode 'b'
with auxillary mode 'c'. Channel 'a' must be
free or a 'Channel already open' (129) error
occurs. Examples:
OPEN #1,4,0,"K:" - input from keyboard
OPEN #2,8,0,"P:" - output to printer
OPEN #3,12,0,"D:FILE" - random access to disk
OPEN #4,9,0,"D:DATA" - append-output to disk
OPEN #5,13,0,"R:" - concurrent to RS232 (modem)
OPEN #6,6,0,"D:*.TXT" - directory access to disk
(reads directory of "*.TXT" mask)
CLOSE #a Closes channel 'a' (freeing it for use)
GET #a,b Reads a byte from channel 'a' and stores it in 'b'
PUT #a,b Puts byte 'b' onto channel 'a'
INPUT #a,b$ Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores it in 'b$'
INPUT #a,b Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores the numeric value of it in 'b'
PRINT #a,<stuff> Just like the normal BASIC PRINT statement, but
sends the information to channel 'a' (semicolons,
comas, and mixed types are of course allowed).
STATUS #a,b Reads the error 'status' of channel 'a' and stores
it in 'b'
XIO a,#b,c,d,e$ General I/O call. This a little complicated and
may be expanded upon in a future revision. Just be aware of the
following:
a - command
b - channel to use (usually must be free)
c - auxillary mode 1
d - auxillary mode 2
e$ - file or device to act upon
Examples:
XIO 32,#1,0,0,"D:FILE,OLDFILE" - renames file
XIO 33,#1,0,0,"D:OLDFILE" - DELETES file
XIO 34,#1,0,0,"D:GAMES" - creates a directory in My- & Sparta-DOS
XIO 35,#1,0,0,"D:NEWFILE" - locks a file from over-write and
deletion
XIO 36,#1,0,0,"D:NEWFILE" - UNlocks a locked file
XIO 40,#1,4,0,"D:PROG.OBJ" - loads and runs a binary file
(like "L" in Atari and MyDOS)
XIO 40,#1,5,0,"D:PROG.OBJ" - loads a binary file
(like "L" in Atari and MyDOS with the "/N" option)
XIO 41,#1,0,0,"D:GAMES" - changes default directory that
drive/subdirectory (all calls to "D:" will now occur within
that drive/directory)
XIO 254,#1,0,0,"D2:" - FORMAT a disk (in Atari DOS 2.5, this is

format 'enhanced', to format 'single' density, use XIO 253)
(in MyDOS, this is format, but not 'enhanced', use
XIO 253,#<channel>,1,0,"D<drive>:" for format a drive in enhanced
mode).
NOTE: 39 and 40 are the same. Also note the useage of AUX1 in the
"XIO 40" example.

---=== Getting Atari files to an IBM: ===---

Q.1) How can I read Atari disks on my IBM?

____
[note:] Someone please give more details or corrections here! Thanx!
~~~~~~~
A.1.1) If you have double-density Atari disks, you can use the program
"Util" on the IBM which can read double-density Atari disks. Please
see the Atari 8-bit FAQ for more details.
A.1.2) If you have an Atari 1050 disk drive, you can use the program MULE
to copy files, one file at a time, 20k chunks at a time, from the
Atari to the IBM. You first must format a 180k disk on your IBM,
the run MULE on your Atari to get a file onto the MULE disk, then
run MULE on the IBM to get the file onto the IBM. Tedious, isn't
it? MULE wasn't meant to be a fully-functional program, just a
demo to show that this was even possible.
A.1.3) If you're fortunate to have a Black Box interface on your Atari,
you can get an external IBM drive and the Black Box's add-on, the
Floppy-Board and simply copy files from your Atari disks or hard
drive(s) onto IBM disks via the floppy board, then load them up
on your IBM.

Q.2) Ok, I can't do any of that, now what?
A.2.1) You can use SIO2PC, which is a program for IBM's which turns your
IBM into a set of Atari disk drives. You need the SIO2PC cable
(which you can purchase, assembled or unassembled, or buy parts
and build it yourself) and the SIO2PC software (available at UMICH).
Connect your IBM to your Atari, load SIO2PC, and then run the
program FILE2PC on the Atari to transfer files to the IBM's hard
drive. Or instead create a disk image within SIO2PC and copy files
from one disk (a real Atari floppy) to another (the SIO2PC image)
with the Atari or MyDOS "C"opy command. If you want to extract files
out of the SIO2PC disk image file and store them on your IBM's hard
drive or floppies as single files, either again use FILE2PC or use
S2PC, an IBM program which can extract files from or add files to
MyDOS-compatible SIO2PC disk images!
A.2.2) You can use two modems to download files from your Atari 8-bit.
A.2.3) If you don't necessarily want files that you already have on your
Atari 8-bit, you can download files from the huge collection
available at FTP sites and Atari 8-bit supporting bulletin boards
and save them onto your IBM.
A.2.4) If you have only one modem, so you can't connect both your Atari
8-bit and your IBM together via modems, you can do it via null-
modem, OR you can upload files from your Atari to some bulletin
~~~~~~~

board or account you have access to, and then connect the modem
to your IBM and download the files.

Q.3) Is there any easier way to get Disk Communicator (Atari disk image)
files to and from SIO2PC disk images or PC Xformer XFD disk images
other than using Disk Communicator 3.2 on my Atari! I mean, both files
are disk images! They're both on my PC's hard drive! <cry>
(AND NOTE: DiskComm. doesn't like SIO2PC a lot of the time anyway!)
A.3.1) Yes! There's a new IBM program out called DCM2DSK.
(Why "DSK" and not "ATR"? To keep people from getting confused with
the ATR-8000(?)) The current version is '2' and it's available at
UMich's archives and probably elsewhere. Filename: "DCM2DSK2.ZIP" in
the SIO2PC directory.
A.3.2) There's also a new program which converts DCM's to XFD's. I need to
look at it myself first before I can describe it (or someone help
me, please?)

---=== Where to get or FTP files mentioned in this FAQ: ===---

The PC Xformer 2.0 and 2.5 can be downloaded from the "ftp.clark.net" FTP
site:
Directory/file-path: systems/msdos/emulators/xf25.zip (or xf2.zip)

PC Xformer 3.0 can be purchased for $29.95 (prices may vary) from:

1227. Network stuff for XL's...

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-15 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3u9goq$4d5@nic-nac.CSU.net>
Source record: 90048

Ok, let's see.. We've got:

(1) Gamelink
(2) MUX
(3) Modems (computer <-> computer)
(4) Modems and network accounts (computer <-> facility <-> computer)

Why don't we have some suitable, generic way of handling all of these forms of communication?

Why not an "L:" device for the Atari. One not unlike the "M:" (MultiMouse) device. The user choses which version of the device to use (in M:'s case, either joystick controlled, mouse controlled, or trakball controlled) and the software which talks to the device doesn't care (or know).

Why not the same for the above four I/O mediums?

If you have a GameLink setup, one person loads a version of L: which handles GameLink-master I/O, and the other people load GameLink-`slave' I/O handlers.

For MUX, each person loads up an L: handler and tells it which box they are in the Local Area Network.

For modems, one person calls, the other receives- when L: is first loaded, a terminal session could appear!

With this, Atari users with GameLink II and MUX could BOTH take advantage of their respective setups - but also, users who simply have modems, or who have modems with some sort of IRC or other realtime chatting access could ALSO use that to play games with each other...

And no matter what setup, only one version of any multicomputer game would be required!

And it would ALSO allow for future hardware upgrades- perhaps very simple joystick port hacks instead of GameLink II- or different realtime network protocols (more interactive Web stuff is coming, you know! :)) or MUDs or something!!!

Is this a neat idea or what!?!? :)

Comments????

1228. 145,000 colony score in M.U.L.E.!!

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-15 00:00:00 UTC
From: ziggy29@rahul.net
Message-ID: <3u9j32$76s@bug.rahul.net>
Source record: 90049

OK, so we cheated. But it really happened.

On the 12th turn, I had 46 units of Crystite; my wife had about 25.

In Auction #12, she bought one unit of crystite from me at a price of $772. Yep, that's not a typo--$772. The store was only offering $80 in that auction.

My final score: Over $72,000, including over $41,000 in goods! She had over $39,000.

Okay, fine...put an asterisk on the score... :)

Actually, I have seen Shamus listed at TOAD computers, but I am looking for
case II...the one I prefer. And that's strange, because now I don't even
bother with PC shoot 'em ups.

>I'd like to start the following thread. Hopefully we can come up with an
>interesting WEB page.

My old system, which I am in the process of upgrading, consists of

800XL w/256K Omnimon, Omniview
1050 drive w/US Doubler
assorted broken joysticks
many assorted disks with some good stuff and a lot of junk, (some friend of my son *borrowed* most of my game disks (100 or so) to use on an Apple IIe for data storage arghhh!)

Now added are:

130XE to be upgraded to 320K
1050 drive with bad motherboard for parts (mech is good)
a lot of replenished software thanks to James!
SIO2PC cable to my 486DX4-100 (which now spends more time as a drive for my Atari than as a PC).
Ven-Tel 2400 baud modem, although I usually use PC Xformer and my 14400 modem

I stopped into a store that is still a part-time Atari dealer (mostly just Jaguar now, although he has some ST software. While he said he didn't have any 8-bit stuff, he gave me a carrying case from Atari with 2 carts - Pac-Man and Qix. This brings my total carts to 5.

I plan on adding a 1010 recorder, more for nostalgia than any practical reason.

I also am doing some programming for the first time in years and find that I enjoy it as much as ever on the Atari!

Sorry, but no asterisk, since the idea of the game, besides competition, is to have the colony do well, right? Good show!

1232. Re: Atari GameLink; WAS Re: Genesis controllers for 8-bit?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-15 00:00:00 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <JzGCYBP.lmcclure@delphi.com>
Source record: 90053

In a message dated 7-11-95, Gary Holder said:

"Now that all of us who stalk yard sales have 8-bits piling
up in our basements, how about using the same Gamelink
technology to do a one-player, multiple screen game? Like
Way Out or a flight game using 3 screens to show side views?"

Believe it or not, this is not a new idea. There is a game on the Amiga (Fighter Duel Pro) that allows for a second Amiga to be hooked up via the parallel port, and the screen on the second Amiga then acts as the "rear window" of the plane you are flying. As I recall, this can still be used in conjuction with it's modem or null-modem 2-player link feature, as that uses the serial port.

So, not only is your suggestion feasible, it has a precedent. All that is needed now is for a programmer to take the ball and run with it.

I'm a hardware-oriented person myself, but when it comes right down to it, programs make the world go 'round. After all, a computer without programs is like a car without gas. <grin>

1233. Odd ball scavaging hunt

Newsgroup: comp.sys.atari.8bit

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <142249@cup.portal.com>
Source record: 90054

Doesn't really matter much, but the other day when I was making
a run to a local thrift shop to see if they had anything of merit
I decided to chech out these professional video loops. They were
similar to ones we had at the pharmaceutical company where I used
to work so I figured they must be something odd. Sure enough, It
was Atari CES 1982 tapes along with one titled Chris Crawford
seminar on game design, 1983. I didn't pick 'em up because of
the odd format, 1"<???> & price $1.49 each. A little bit of
history though.

> 1200XLs with pictures of Atari employees that appear when you boot without
> a cartridge...

No, mine doesn't do that, I just get a nice shimmery "ATARI" in big colorful letters, and then the self-test when I press the Help key. Is there more than one version of the ROMs or something?

Two more 1200XL questions:

1. I just read that the 1200XL is lacking one of the signals on the SIO port--is this going to affect a homemade RS232 interface? (I'm planning to build one soon from Kenneth Siders' plans available at CAIN).

2. The more I play with this thing, the more I think the 800XL was a step backwards in a lot of ways. Sure it has the PBI and it's smaller, but it also has that same crummy key layout (with Break right next to Backspace) as the 800, the evil Revision B Basic in ROM, no chroma signal, etc. So, WHAT was Atari thinking? Why didn't they keep the good things about the 1200XL when they were designing the 600XL and 800XL???

Hmm... this is going to keep me awake all night... 8-)

---Alex

1235. GET THE PAL UPGRADE! :)

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-16 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3uajdf$sj1@nic-nac.CSU.net>
Source record: 89957

I've got a PAL ANTIC hooked up (thanks to Bob Wooley (for the chip) and Ben Corr (for delivering it) - and to both of them for being so great!).

Unfortunately, at the moment it rolls BADLY, BUT - other than that, it works very nicely. I noticed some music in Cool Emotion plays more slowly (but some of the digital and synthesized voice sounds are aligned better), as well as the buzzer and keyclick speed differences.

I'm hoping the fix for the roll is a trivial one - I guess it's in the latest AC (time for Mr. Kendrick to subscribe!!). From what I've seen (very little, actually, but it was stuff which DIED completely on my NTSC machines) it REALLY works well!!!

Anyway- if you're interested in some of the EXCELLENT European software, GET THE PAL UPGRADE! (Sometimes known as "nir-PAL" ;))

... man some of these new upgrades I'm getting even >I< can install! :)

-bill!

Puff won't make the R:P:, however, it did not by any means seem like a difficult hack. It was essentially an R:Verter with a 16550 UART and hardware flow control.

Maybe someone could ask him to donate the schematics so it could be manufactured in low quantities by a hacker.

The Star Raiders keypad is the same in the way it functions to the original round-key keypad for the 2600 which is from the OLD OLD days for things like Basic Programming, like 1978 even. That's why perhaps it is mentioned in the tech refs.

Someone posted some code, I think it was assembly, months and months ago. Nothing in Basic.

Stick and Strig don't work. You'd have to poll the port directly somehow.

Source record: 89964

The mortal Alexander Chamberlain wrote:

: 2. The more I play with this thing, the more I think the 800XL was a step
: backwards in a lot of ways. Sure it has the PBI and it's smaller, but it
: also has that same crummy key layout (with Break right next to Backspace)
: as the 800, the evil Revision B Basic in ROM, no chroma signal, etc. So,
: WHAT was Atari thinking? Why didn't they keep the good things about the
: 1200XL when they were designing the 600XL and 800XL???

The 1200XL was designed prior to the severe cost-cutting measures which were implemented to compete with the C=64. Yes, it was less heavy-duty than the 800 but not as chintzy as the true XLs and consequently the XLs are better than the XEs in the durability department.

That being said, the 1200XL has some profound flaws that make it a machine which is only exceptional after a lot of modification. It is important to put the real XL OS in it, and as you do this, the Basic can go in, and cut the resistor to get power flowing through the SIO, and the video jack is horseshit without the Supervideo hack. Then you are still left with the task of hacking on a PBI if you want to use it with a hard drive unless you MUX it. And even so, if the memory addon that FTE is working on plugs in through the PBI that's another reason you'll want it. That is not a trivial hack.

When you are done you have a machine that is flawless and feels the best of all the XL/XEs and in the end that's what really counts.

: James.. that's a killer idea! Wasn't Glenn Saunders working on something
: like that?

I'm working on a CD containing Starpath Supercharger games for the Atari 2600. Not quite the same.

An ISO-9660 CD handler would be very useful for the Atari 8-bit, though. Single speed CD-ROMs are now practically throways such that it almost makes sense to buy one for the 8-bit.

I think the main stumbling block is block size (1K?). Bob got IDE drives working so I guess anything is possible.

MANY 1400 series motherboards were manufactured. A great many. A serious run. It was beyond the prototype stage. But this was around crashtime and they plowed most of these under although a surprising number of motherboards survived and fell into the hands of Best, B&C and other Misc. people (like myself).

They never got cases or keyboards for any but the prototypes. There was a big hubbub over Atari's contracting with Mitsumi? for keyboards. However, they were indeed serious about making it unlike some other vaporware which didn't get much beyond the computer-show or rumor phase. Remember, the 1400 was mentioned in official documentation like DOS3 or in mailorder advertizing. They were indeed serious about releasing it until things started collapsing.

: I REALLY would like to get my XL hooked up to my 14.4k modem!! :(:(:(

Bill,

First, if you really want 19.2 you will need a Black Box/MIO!!

And only the Black Box has true hardware flow control... really needed
for anything legit above 9600 baud.

I do have a rev. 4 P:R:C but can only get 4800 baud out of it when hooked up
to my 28.8 Supra!! :)

I also have a rev. 3 P:R:C which does 9600 baud quite well.

Does anybody know anything about getting 9600 baud plus out of the rev. 4
P:R:C.??

Yes, I have checked my settings, and am running software flow control.

By the way, Bill - I have seen true 19.2 from my Supra when running Bobterm!

Ice-T begins to lose speed at about 7200 baud even though it will connect
at 14.4/19.2 and FlickerTerm 80 will also connect at 14.4/19.2 and do
right at 14.4!

BUT, at these speeds I have to run both with hardware flow control and
the only real way to do that effectively is through my Black Box.
Software flow control above 9600 is problematic, at best.

Now if Bob Puff wouild only release his R:P interface!

Anybody got any clues about the rev. 4 board in the P:R:C and why it
only wants to do 4800 baud?? Mike, are you listening/lurking at FTe??!!

It just struck me! It would be easy to hack the guts of a XF551
into a 1200XL, run the cables out and mount the drive on top. Install the
Bob Puff 3.5", 720K upgrade or Dual upgrade would make it even better!
Hummmm, I'm goint to have to keep my eyes open for a 1200XL. Need one
anyway just to complete my collection.
One drawback; It would have to have 2 power supplies, one for
the 1200XL and one for the XF551. Still, it could be done.

Hardware:

2- Atari 800XL's 1 with Newell 256K and Omniview upgrade
Both DOA!
1- Atari 1050 Floppy disk drive & Spare belt
Worked last time XL was online.
1- Atari 1030 300 Baud modem (yeah, 300 baud!)
Worked last time XL was online
1- Taihaho Computer Cassette
Worked last time XL was online
1- Okimate 10 Color Printer w/ Atari interface
Works (self test on thermal paper, no ribbon)
1- Atari touch Tablet (no software)
????????
1- Atari Trackball
????????
1- Composite video monitor cable
(Atari Monitor jack to RCA type A/V plugs)

SOFTWARE- 5 1/4" floppy

Home Pak
WP, COMM, Home inventory
HACKER
game
Planetfall
game
The Neverending Story
game
The Eidolon
game
Bonus for high bidder
All shareware and DOS floppies I have Too much to list

SOFTWARE-8 Bit Cart.

Basic Computer Language
Star Raiders
Donkey Kong w/docs.
Centipede
Pac-Man
Missle Command
Popeye w/docs.

Best offer by 7/22/95 (12:01 am EDT) or whole batch goes into the Trash (6:00 am EDT 7/22/95). You pay shipping or pickup Central Florida. Prefer to keep software in lots, ie. disk and cartrage, but will separate. Will separate hardware due to shipping costs.

ONLY 5 DAYS LEFT! GET YOUR BIDS IN TODAY

Current high bids;
Hardware items $20/$10 separate items...
Software Cratridges $25

1252. Genesis controllers for 8-bit?

Newsgroup: comp.sys.atari.8bit

From: e.halliwell@genie.geis.com
Message-ID: <199507161552.AA275869959@relay1.geis.com>
Source record: 89974

For all this discussion, I can't believe nobody has pointed out the Atari 7800 controllers! For the record, these two-button controllers worked by wiring one button to each of the paddle lines, with a resistor. For downward compatibility, both buttons were also wired to the trigger line, which is why they work fine with 2600s and so forth.

If someone wanted to write a game that required two buttons, they need look no further than the 7800 stick. Best Electronics even sells a great heavy-duty model with an autofire switch.

Hey! That's pretty good.

Usually when i play with someone else, were at eachother throats....it sounds like you played for the colony.....what a team player! (yeeaccchhh!!)

the most i ever got for the colony was just over 120,000.....and personally around 59,000 just for me!

ALSO: Why is what you did cheating??? There is no extra money being generated in what you did.... Actually, you may have lost your wife a better score!!! You would have gained $772 from the sale and lost 1 good(crystite plus its current colony worth), and your wife, +1 crystite but a loss of $772 for the purchase. So, at the end of the game, your wife would see the worth of the crystite under the "goods" category. And the value there is based on the price of crystite in the colony, no matter what she paid. So the crystite she paid $772 for would have gotten lumped in with the rest of the crystite. (about $80).

Ya know, it sort of reminds me of einstein.....why? because matter cannot be created or destroyed.....meaning: everything in the colony (goods, money, property) will remain in the colony in some form or another...money will not be created or destroyed...(for the colony)....

the only way to make money for the colony is to produce stuff.
BUT you can make yourself personally rich off of others (no producing needed)

So really, if you calculate what is actually being done, there is little change...your wife is just getting ripped-off.....

No, because when something sells at $772 in the 12th auction, that
commodity is valued at $772 in the final score. And that includes *all*
units of crystite. Since she had about 25 herself, *all* of it was now
worth $772 instead of $80.

: So really, if you calculate what is actually being done, there is little
: change...your wife is just getting ripped-off.....

I used to think so too, until I tried this. She had about $21,000 going
into turn 12 and nearly $40,000 coming out of it. So I don't think she
got ripped off.

Thanks for the info about the 16550, explains a few things, but I think
you may be off in it would need a few extra parts to implement the printer
interface.
16550 has a couple of features like baud rates up to 115k with built in
buffer, but those puppies are expensive. My sources are all around $10/each
which makes them too expensive for me to smoke. I can see why Bob wouldn't
commit to a production run. Couple of hundred boards X $10 for each
chip plus whatever else he's got in there. It could easily be a $5000+
investment.
Rick

Did I werite PICTURES!@##@. I meant names. Yes, more then one revision,
I had one that showed the develoment teams names, but hacked an 800xl
OS into it before I realized it was rare.
The only difs between the 800xl & 1200xl serial buss is there is a resistor
in the 5V line on the 1200. You can just jumper this if the hack doesn't
run without it. The earlier 400/800 computers also had 12V on the serial
line, but I don't think anyone used it.
IMO, I'm a little wishy-washy about the 800xl being a step back. The first
1200XL I was going to buy, they wanted $249 + $50 for a basic cart. First
800XL I got was something like $120 with built in basic. I like the
expansion buss on the back of the 800XL and the cartridge slot, but I like
the keyboard on the 1200XL as well as it's robust design. All socketed chips,
runs from standard 9 VAC vs the 800XL bricks that alway burn up. It's
much more of what I wanted in a home computer then my 800, 800XLs, or
130XE anyway.

1260. Idea to reduce blue in CV!

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-16 00:00:00 UTC
From: toastman@armory.com
Message-ID: <3ubtbu$qqk@news.scruz.net>
Source record: 89982

I'd like to know how stupid this idea is...

Now, Colorview currently displays a 4096-color pic by cycling through three Gr9 screens: one red gr9, one green gr9, and one big old blurry blue gr9. ack.

I'm thinking... who says the blue one has to be gr9? If it were a gr8, you could make the border TOTALLY black, and make only the remaining 8 colors blue. I know that will reduce the amount of colors to a lousy 2304, but that's enough. In fact, the documentation to a JPEG viewer I have says that the human eye can distinguish less differences in blue than any other wavelength, so this works out rather nicely.

The thing I'd like to know is, is it possible? I don't know much about the insides of the Atari 8-bit so I don't know whether any complications would turn out in trying to do this. But if it can be done, IT MUST!

Thank you.

1261. Panasonic 1091i for sale or trade

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-16 00:00:00 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <hVIgIhD.lmcclure@delphi.com>
Source record: 89983

UPDATE:

The Star NX-1000 has been traded. Only the Panasonic 1091i remains available for sale or trade. I consider this printer to have a value of approx. $70, but would accept $60 + shipping for a cash sale.

The 1091i is very good to excellent condition, with the manual, original box, and packing materials.

ITEMS WANTED IN TRADE:

* CSS Ultraspeed+ OS + <$12 cash
* CSS XF single (3.5" drive) upgrade (including 3.5" mech) for my XF551
* FTe Sweet 16
* Transkey
* Newell or ICD RAMbo upgrade with RAM + <$30 cash (<$40 if no RAM)
* 3.5" 1" high SCSI drive of equivalent value
* External 14.4Kbps data/fax modem
* Set of four 1meg SIMMs, 120ns or faster
* Set of two 1meg 2-chip or 3-chip SIMMs, 70ns or faster + <$15

If you have something not listed that you think I might be interested in, make the offer...the worst I can say is "No thanks".

If you have an item you want to trade but think it is worth more than the printer (i.e., a Quantum LPS240S) for the let me know how much extra you would want from me.

BONUS: If anyone lives in the Little Rock area, and wants to make the trade, I'll throw in a sizeable box of fanfold paper I never got around to using, and a plastic printer stand.

>active! But then again, there is a fairly active group over on Vancouver
>island, they even have their own BBS running on an 8-bit, with like
>500Megs with Swapped partitions on a blackbox... ANYWAYS

The name of the BBS is The Pothole (604-642-6795) and it is a member of the USF & IAN network. Although I am a Co-SysOp, I don't know exactly how many megs the BBS has but I think it is something like 200. We had a crash sometime ago and lost tons of public domain and shareware software, however, not one 8bit file got nuked!

The name of the local Atari club is Garden City ACE. We actively support the Atari 8bit & ST machines. We have 200 to 300 disks worth of 8bit software. Our 8bit Librarian is currently working on creating a "Best of" collection. We do have some real useless software which could easily be nuked such as a graphics demo written by "Software Engineers" at Atari Inc back in 1980. It is nothing more than a few lines which wander around the screen. Even I could write such a program!

GCACE also publishes a newsletter 6 times a year. It is filled with news and articles written by club members. We never reprint stuff from the net! The club address is 1003 Amphion Street, Victoria, BC V8S 4G2. If interested, I could send you a copy of the Atari 8bit software catalogue via mail at no charge. Just send me your mailing address via e-mail. BTW, membership is $25 per year.

Geez! I talk about making an 8bit CD - and about 10 copies, then suddenly
folks are suggesting some sort of professional revision!

It's going to cost me about $50.00 each to create this CD - so forget
it. I have no intention of dumping some small fortune so you folks can
"consider" wether or not its worth my effort.

I'm definately going to make a CD for myself. If I find it viable AND
LEGAL, then I'll consider making copies for others.

From: jeking@xmission.xmission.com
Message-ID: <3ub7qo$128@news.xmission.com>
Source record: 89986

To several of you out there begging to use a 2x or 4x CDROM on your
8bit. It IS possible.

Most CDROM players (good ones) are SCSI based - so they could
hypothetcially be plugged into a Black Box.

The only thing needed after that would be a program to access the ROM
"driver".

From: rconstan@gate.net
Message-ID: <3uc6pr$i12@news.gate.net>
Source record: 89987

I never knew this group existed, or I would have posted long ago. My name is Randy Constan, and I was the sole propriator of Elfin Magic Software. Back in the mid to late 80s, Elfin Magic produced an article for Analog Computing magazine, which subsequently developed into "Circuit Database II", our first commercial package. After that came "Checking Account Manager", and our most sucessful title, "Super 3D Plotter" (versions I and II).

I've recently moved to Florida, so the addresses on all my software packages is no longer valid. I'll be moving again an a few months, and will post a new address for anyone interested, after the dust settles. In the mean time, I wanted to offer a freindly hello to fellow Atarians. Though I must confess I seldom use the 8 bit anymore, I do want to offer support for anyone still using (or interestd in using) Elfin Magic products. Though my snail mail address is still in flux, I'll probably be keeping this email address for a long time. Viva ATARI!

1266. Question: SIO protocol, What's the answer?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-16 00:00:00 UTC
From: lucius@astro.ocis.temple.edu
Message-ID: <3uc6nj$k17@cronkite.ocis.temple.edu>
Source record: 89988

I'm writing a disk drive emulator, and need to know how to reply to a read command to sector 1024 when I don't have a sector 1024. Dos 2.5 looks for sector 1024 when reading the directory, but since a 90K disk doesn't have a sector 1024, I can't give it. I've tried sending 'E' for error, and 'A' for acknowledge, but it's not the right answer.

So, what's the answer?

Ok, you guys got me to dig out my Atari 800. At one time Atari
was the ONLY computer that I would buy. I started with the 800
(which I've still got) then a 800XL, 1200XL, 130XE and then
finally a 520ST (I was a registered developer for Atari on the
ST series when they were released). I upgraded the 520 the
hard way 'cause at the time there was no other way to do it!
Soldered all that stuff by hand. I forgot just how much fun
the 800 is! Now to the main question. Where in Gods name can
I find some power bricks for the 800, 810 and 850? And if there's
an FAQ, point me in the right direction! It feels good to use
an old friend again (always thought that the 800 had the BEST
damn keyboard in the world).

James, not that I've been fooling around with it, but by accident I
was reading a DOS book with some CD ROM stuff & according to that source,
a CD ROM is just seen as a big floppy by the system. I assume that means
512 byte sectors, but I didn't read into long enough to find out. If
nothing else, you should may be able to read the fist 1/2 of each sector
& since there's already software to read IBM disks on some CSS hardware,
it probably wouldn't be that hard to hack something up.

Joe, it help if you give where you're located, someone may have a source they can tell you about. Other then that, just about any 9 VAC transformer well work. Just make sure it will put out at 31 VA. Most wall wart type supplies only do about 1/3 that so it takes a relatively good sized transformer. The only things that don't take a 9 VAC supply are the 800XL & later computers along with a couple of odd accessories, like the 1027 I believe.

writes:

>Man, who started this stupid thread "nir-PAL"? What a classic example of
>how nonsense gets spread around on networks, like so much fresh manure.

Ben,

Although there might not be an "official" product such as a
nir-PAL, I happen to think it has a nice "ring" to it.

For a "no-brainer" upgrade, it seems kind-of strange to me that
nobody bothered to do it (or at least document that it was possible) at
any time for the last 15 years...

Granted... a mike-PAL, ben-PAL, bob-PAL, bill-PAL, john-PAL,
might not necessarily cut-it...

I don't know who started the thread, but I do believe in giving
credit where credit is due. A "PAL to NTSC Upgrade" has no charisma in
the slightest... I place the first vote to "officially" dub it the nir-PAL!!

Besides.... He's a heck of a nice guy, and is probably too modest
to do so on his own behalf!!

Just my 2 cents worth... Mike(FTe)

1273. DigiKey has MAX232, any other suppliers?

From: lucius@astro.ocis.temple.edu
Message-ID: <3ucon4$1fc@cronkite.ocis.temple.edu>
Source record: 89907

For people who might want to build the SIO 2 PC
interface/adapter/cable, I just wanted to say that DigiKey has the
RS-232 transmitter/receivers.

The discription:
High-Speed, +5V Pwrd, Dual RS-232 Transmitters and Receivers
The part number is MAX232ACPE-ND, the price is 4.32 for one.

Now, for those who know about these chips, there's a version of this
chip that doesn't say high-speed, and is cheaper, but I wonder if it
would work at 19.2 kbps.

William Kendrick (kendrick@zippy.sonoma.edu) wrote:
: Actually, I believe the BIGGEST problem with accessing any current CDs using
: an 8bit and a BlackBox is the block size on the CD - 1K (or more???).

The MIO is limited to 256byte, whereas the Black Box (and supposedly the
soon-to-be-released KP Interface) are supposed to be able to use 1k+ blocks.

: Also, the format of the files themselves is another problem... with hooking
: up a hard drive to the Atari, you first format it for the DOS(es) you're
: going to use, THEN use it.

The only challenge is in figuring out how the CD is accessed. What is
required.. All newer computers are capable of seeing the same CD
correct? Therefore, its simply a matter of reading the first few tracks
to identify the CD then access it.

Of course, the 8bits 16meg limitation could be the biggest stumbling block.

From: khaley@nova.gmi.edu
Message-ID: <khaley.805994286@gmi.edu>
Source record: 89911

I know this is probably better suited for one of the games groups,
but I am currently playing Ultima III on the 8 bit and have run into
some seeming difficulty during the game.

My chartacters are currently up around Level 7, with 600+ hit points,
yet their magic ability has not increased one bit! I know that
you need to go to Lord British to advance to the next level once
you have the required experience, but how do you raise your
magic points? They're so low I'm still limited to casting weak
spells.

If anyone is currently playing this or can remember this aspect of
Ultima III, please let me know. Any help would be appreciated.

Thanks.

Ah, what the heck.

>I'd like you all to describe your Atari computer setup. What
>peripherals, device, odd attachments does it consist of?

System 1: (mine)

Stock 130XE with 1050 disk drive, 1030 modem (currently doesn't work),
Hundreds of PD/shareware disks, tons of commercial software.
I also have PCXformer for my 486 and a parallel printer interface
to hook up my XE to my PC printer if needed.

Several joysticks, paddles , and lots of junk and semi-working
stuff I have for spare parts.

System 2: (at a friend's, though I own most of it)

Stock 800XL with 1050 disk drive, Commodore 1702 monitor,
more joysticks, commercial, and PD/shareware software.

Pretty much has become a hobby for me, I play RPGs on it when I get
the chance and fiddle with programming and hardware. Recently, a
friend of mine has been caught up in my RPG hobby, now he has my
other system. At least it's getting used. ;-)

: spells.

There is a special place you need to go. You will also need money--
100 GP for every point you raise one attribute for one character.

*** SPOILERS AHEAD ***

There is a place called "Ambrosia" where the four attributes can e
boosted. You must be in a ship which sinks into the whirlpool to do
this. You must then find your way to the four shrines--one for
each attribute.

If you want to raise wisdom, for example, so your cleric can get
70 MP and cast the ZXKUQYB spell (the Cleric sucks offensively
until you get this spell), find the shrine of Wisdom. Assuming
your cleric starts with 25 MP, you'll need to make an "offering"
of 4500 GP to boost the cleric's MP to 70.

There is also another use for the shrines. But since you haven't
asked for that, I won't spoil it.

Bring some keys and gems before going to Ambrosia. Also, you
will need to defeat some pirates and commandeer their ship if
you are to return to Sosaria successfully.

: If anyone is currently playing this or can remember this aspect of
: Ultima III, please let me know. Any help would be appreciated.

: Thanks.

$10 fo a serial chip is expensive. I have a parts drawer of 8250, &
16450 all essentially free. For instance, nephew wanted to expand
his clone so I found a busted 286 mother board with 1 meg of dram
for $5 and had an old busted one with a meg that was from a repair job
where I installed a new MB. New memory board was only $15 so for $20
total I got an extra 2 megs to him. Both MBs had built in serial so
I think I ended up with 3 or 4 8250 types out of that. $10 vs free
is really a mark up! Most of my projects like the clock speed up or
whatever is from from junk clone MB.
This is one of the things you're going to have to trust me on, one of
the products I developed used a $.25 componet in a device that sold for
$1.15 and you wouldn't believe the grief I got from bean counters.
Remember I was the inventer of the thing, patents & everything, and the
resulting turmoil within the company went all the way up to the Sr
VP level with the spin on it was that I had probably killed the project
because of the expensive componet. It was the only way the thing could
be done and no alternatives were ever found by any of the people
attacking me. Ended up being a product anyway with some success.
The $10 for a single part in a product that was supposed to sell
for something like $59 is a awfully high price! Even for screwing
around like I do it's to much to pay since it's a somewhat esoteric
exercise anyway. Parts for a project like that would run about as
much as buying a new PR!
Rick

Somewhat of a spoiler, but: To advance skills first get all the money you can muster. Don't use the JOIN gold command if you have more then $9999 gold or you lose everything in excess of that amount. About [10 gems, 10 powders, 10 keys] are also handy. Wander around until you get attacked by a ship. If you win that battle, sail the ship around until you are sucked down the whirlpool. Everything is somewhat obvious from there if you've been getting the hints from bars, oracles, etcetera.

>would work at 19.2 kbps.

In the RS-232 world, "High Speed" is generally taken to mean above 19.2k bps.
The most useful of the Max chips that go up to 19.2k is the one that needs no
external capacitors, but is otherwise identical to the Max 232. These are not
nearly as widely available as the Max 232, though, and 4 capacitors is just
no big deal.

I put mine on a small piece of perf board and mounted it into a null modem
type housing along with the DB-25 and oddball Atari connector, with lots of
room to spare. The Max 232 is available from most any decent parts house,
even local ones, as are the capacitors.

Chris, I don't know about YOU, but I'd HATE having to use some program to copy from a device to a real drive (be it floppy, hard drive, RAMdisk or SIO2PC image).

And, I didn't say ANYTHING about rewriting any DOS for the Atari.. just adding a device driver which was intelligent like DOS is (hell, stick it in some 16K bank somewhere.. I don't care!).

I mean, the device handling of the Atari is EXCELLENT, even compared to, say, today's PC's! ("con", "prn" - those look far too much like filenames than devices. They almost did it right with drive access (A:, B:, C:, etc.)

Five excellent examples of great use of the device handler table include:

(1) Replacing any old device with a new driver (80 col E:, fast E:, etc.)
(2) Adding similar devices (G: - printer with graphics support)
(3) Software not caring what hardware you have - it's all handled by the device driver (R: - how many different things can be hooked up and used as R:? 850, P:R:Conn., BlackBox, MIO, SX212, etc.)
(M: - multimouse.. software accessing M: doesn't care which M: you're using.. the joystick one, the ST Mouse one, the Amiga Mouse one, etc.)
(4) My own idea about multi-computer software using a device handler, so it won't care what setup you have. (GameLink, a coupla joystick cables plugged together, MUX network, a modem, etc.)
(5) David Firth's "H:" device in his Atari emulator for Unix (and I belive ST XFormer had a similar device which gave access to the machine's drives not unlike PC Mirror mode of Atari Disk Emulator) and my own idea of a CD-ROM device driver. (ie, both are accessed 95% like normal disks, so when running any current software, you replace "D:*.GIF" with, say, "H:*.GIF" !!!)

Anyway.. >I< think my idea is good. I do agree that CD ROM access through emulators and SIO2PC access is of course the easiest way to do it, but it's by far NOT the fastest access!!!

ATARI HARDWARE AND SOFTWARE FOR SALE

Hardware:

o Atari 800 computer w/ 48K, GTIA, power supply, dust cover, RF cable
o Atari 810 disk drive w/ SIO cable, power supply

o Extra SIO cable and power supply (wall wart)
o Some guts from an Atari 400 computer to use for spare parts
(no RAM, no POKEY, missing one I/O ROM)

Software:

Cartridges
o MAC/65 Assembler/Editor/Debugger cartridge w/ manual
o AtariWriter cartridge w/ manual, quick reference card
o BASIC cartridge, no manual
o Pac-Man cartridge w/ manual
o Asteroids cartridge w/ manual

Disks
o Atari Macro-Assembler/Program-Text Editor w/ reference
card, no manual
o Choplifter

Books:

o Mapping the Atari
o Compute!'s First Book of Atari
o Compute!'s Second Book of Atari

Make a reasonable offer (okay, make any offer <g>) and it's yours. I'd
prefer to sell everything as a package. Buyer pays shipping or picks up
from E. Brunswick, NJ.

Is there really a need for another BBS package ? I wonder if CC65
could compile the 'C' source to CITADEL BBS ? I understand that there is
a version of CITADEL called 'Asguard'(SP?) that runs on the C64 ? I think
that OASIS IV can also network. Of course, the CITADEL BBS source is in
the public domain. I've been trying to compile some simple 'C' programs
in CC65 but keep getting "Out of Memory".

P.S. Does anyone have an ARGV routine that works with ACE C / CC8 ?

P.P.S. The CC65 at the archive is configured to run with SPARTA-DOS.
Does anyone have this in the MYDOS configuration ?
I have an earlier version of CC65 that works in a MYDOS / DOS 2.0
configuration but was wondering if this last release comes in a
MYDOS form ? Why is all of the stuff at the archive configured
for SPARTA-DOS-X ???

Have you considered using ACE C / CC8 / NONAME C and the source
code to Robert Stout's "QWK8" QWK-MAIL reader to create a QWK mail reader
more to your liking ? I fed the source code to Robert Stout's QWK-8
QWK-MAIL program to the ACE C compiler and it was processed without
complaint. Except for the fact that it couldn't use a DOS command line for
ARGV, the program worked perfectly. The code is straight forward and
readable. It wouldn't be particularly difficult for you to modify it to
your particular tastes....

Hi everyone, I'm back from working 12-14 hour days every day for a _long_
time. And it's time to move, so I'm trying to get rid of some extra
stuff:

I have several Atari 1200XLs I'd like to offer for sale. No power supplies,
but I can include video and SIO cables, and I will jumper the resistor on
line 10 of the SIO port to enable "self-powered" peripherals to work.

If you would like one please contact me via e-mail.

James King <jeking@xmission.xmission.com> writes:

>I'd like you all to describe your Atari computer setup. What
>peripherals, device, odd attachments does it consist of?

My Atari 8-bit system (that is, what I have set up all the time...
there is of course TONS stored away, like most 8-bitters I am sure) is:

Atari 130XE
2 XF551 Drives
XMM801 Printer
OkiMate 10 Color Printer
1020 Plotter
1010 Tape Drive
850 Interface
Practical Peripherals FXMT 14.4Kbaud Modem
CX85 Keypad
Wico "Bat"-style Joystick
Commodore 1802 Monitor
Curtis Command Center Plus (with nifty disk cubby hole! :)

Other stuff I somewhat frequently use, but which aren't always hooked up:
Atari Touch Tablet
Atari Light Gun

>In addition, mail me a photograph, and I'll get it scanned in and added

I'll see whether my girlfriend is willing to take a photo of it...
you just want a picture of it as it is set up,right? (ie, desk and all)

Actually there are several formats for CD's, with ISO9660 being the PC standard. For instance, some games come on disks that are readable by a Mac or a PC, but neither can read the other's directory. CD-Rom Today mag on disk is an example of that. The disk has to have a directory structure that can be read by the DOS being used, whether PC, or Atari.

I don't understand why it's going to cost $50. Blank 74min CD's cost less than $10 (my last batch were $6.80 for 100 TDK branded). Professional CD replication houses will make you a one off CD from your hard drive for $45, so if your friend is going to charge $50, I would question his motives.

From: kendrick@zippy.sonoma.edu
Message-ID: <3ucci5$8ei@nic-nac.CSU.net>
Source record: 89999

Actually, I believe the BIGGEST problem with accessing any current CDs using an 8bit and a BlackBox is the block size on the CD - 1K (or more???).

What's the biggest block size any popular DOS on the Atari can handle? 256 bytes? <:^[

Also, the format of the files themselves is another problem... with hooking up a hard drive to the Atari, you first format it for the DOS(es) you're going to use, THEN use it.

I'm not sure what the ROM drive is/does on CD-ROMs... but, of course, now that I think of it, speaking of drivers, we could do something like this:

write our own CD ROM accessor which would be in itself a small MS-DOS/PC-DOS which handles read-only. Access it as a smart device handler (like, "C:" for CD-ROM, although that'd kill the Cassette handler (who cares?? :))) and voila.. it's done.

Kind of like the H: device added to the Atari emulator for Unix... I can LOAD and SAVE BASIC files and do file I/O to it just as if it was an Atari DOS (hell, you can read a disk directory from Unix, too!!).. why can't we add this via software/hardware to a real Atari?

Although - some less optimistic software FORCES you to access "D:" for file I/O, so perhaps an addition to DOS which takes, say, D7: and accesses the CD through it.. (then again, some REALLY pessimistic ;) software FORCES you to use "D1:"! ARGH!!!)

Spartados might handle larger blocks, and most anything is possible with
special device drivers.

Just mount your pc-mirror drive under d7 ;) But your limited to ultraspeed
i/o transfer rates with sio2pc cables. If you wanted fast access to large
amounts of data then a black box/software solution will be required.

<mstatz@cei.net> writes:

>Sorry to jump in on this conversation, but can you compare for me
>the Sweet16 and the Turbo816?

Mark,

The Sweet 16 and the Turbo 816 are based upon a similar concept,
but are completely different in design and operation.

The Turbo 816 was a fairly good sized PCB, with a ribbon cable
that attached to the 6502 socket in the Atari. It tended to flop around
inside the machine, and required a few modifications to the Atari motherboard
to work with the MIO's. I've tried to get one to work with the MIO's, but
haven't had much success. I don't know of anyone who's managed to get one
functioning with the "Black Box".

The Sweet 16 is mounted on a board that replaces your existing
6502, and is fully functional with MIO's and Black Boxes without any mods
to the Atari PCB's. (Basically plug and play, if your 6502 is socketed)

The Turbo 816 has a "Turbo Bus" feature that allowed plug-in
boards to be added. DataQue had actually made a few Static Ram cards and
Clock cards, but they're pretty scarce.

The linear-memory support for the Sweet 16 will be provided on
the MARS 8 via a SIMM socket. (256K, 1mb, 4mb, or 16mb) Since the MARS
also has an R-Time 8 compatible clock, nothing else has really been left
out... Except for an '816 operating system...

More on this later! I'm not gonna say anything else at this point
until it's fully up to spec...

Thanks for the inquiry. Mike(FTe)

Maybe this is a stupid suggestion, but why not create a program designed to specifically read these files off of the CD-ROM and copy them onto your floppy drive? Then you wouldn't need to rewrite DOS for every program you want to have access the CD-ROM, just one modification of DOS designed specifically for using the CD-ROM (making it D8 wouldn't be a bad idea, as far as the handling within DOS goes, but then wouldn't you have to set that on the Black Box?). There's so much nostalgia going around for computer systems right now... imagine what would happen if someone was actually able to hook up an independent CD-ROM drive to an Atari 8bit and create a CD-ROM in the Atari format. Hilarious.... Later,

>anywhere?
>
>Brent

Okay, pull U18 and bend out pins 8,9,and 10. Flip the motherboard over and
solder a jumper between pins 8 and 10 (now vacant).Now pull out U5 and U6.
Bend out pin 3 on U5, bend out pin 10 on U6. Reinsert the chips (oops, and
chip U18 also!) Now solder
a jumper from pin 3 of U5 to the exposed part of pin 4 of U2, and from pin 10
of U6
tto the exposed part of pin 5 of U2. That's it.

>>As far as I know, it, along with the 1400XL and 1400XLD were vaporware.

I've got a couple of 1400XL's here at FTe...

There is nothing really vaporware about them, except that they didn't
go into full production. 4-layer motherboards, custom power supplies,
plastic injection molding, the works!!

I think that they would have been way too expensive to manufacture, and
Atari was probably better off by dropping them. The 1090's on the other
hand, should have been released.

I spent some time on this bit several years ago, when the T816 first
came out - at one point I managed to jack that DataBus into a passive
backplane AT bus, as was able (barely, since I'm not a programmer)
to poke data into a VGA card.

I was in florida then, and a lightning strike took out my hardware.

(It's not NICE to fool with Mother Nature...)

I took that as an omen...

#
#RG>I'm presenting a 'second' opinion about possible commercial
#RG>software on the xmission site. I suppose this is mostly a
#RG>post to M. Current, but I want it to be public.
#
#Agreed...how does one recover from a protected floppy whose media
#has failed due to age and usage that can no longer be replaced. What
#kind of measures does a person take to protect his investment? I
#realize that there are still producers of viable software for the
#8 bit, but where can we draw the line??? I would venture to say that
#most of the developers have moved from this platform in order to eat.

In theory, I agree with the posts here for the most part. But I also
understand human nature. My own example is a case in point. I bought
my first Atari back in about '82. I got a cassette data recorder and
typed in quite a few BASIC programs from magazines. I had to justify
the $50 BASIC cartridge somehow. :-)

I also bought quite a few cartridges for my 8bit. Then in about '85
I bought a used disk drive from a fellow on the net. I got several
disks with it and a few had several commercial programs on them. So
what happens? Did I go out and buy a lot of new software for my great
new disk drive? NO. I played the pirated copies that I got with the
disk drive. I did buy a few new programs but probably less than half
of what I would have bought if I hadn't gotten so many 'free' programs
with the drive. My point is, most people wouldn't buy a lot of software
if they could get most of what they wanted free on an ftp/www site somewhere.
Even if they could buy software that wasn't available anywhere, I don't
think that they would buy much. My take on life is "Why pay 79 cents for
a bottle of water when you can get it free from the tap?". Sure it isn't
quite as good as bottled water, but close enough.

#RG>costly to this A8 community. I would guess that American
#RG>Technavision, B&C, C&T and other retailers have seen an
#RG>INCREASE in sales from the interest and nostalgia produced
#RG>by PCxformer and the availability of 'imageable' copies.

There might be an initial upsurge in sales, but I don't think
that it would be sustainable after people found out that they
could get 'free' copies somewhere on the net.

Note that I am not condoning or condemming the copying of older software. I just think that a freely available supply of it would kill what little sales are left in the Atari 8 market.

In an ideal world a person would only obtain a cracked copy of software to protect their investment in the original (and people would pay for all the shareware software they obtain). But we don't live in a perfect world. Besides, some older software can't be found no matter how hard you look. I'm still trying to get a copy of "Bounty Bob Strikes Back".

Maybe it's just me. Maybe I've grown too cynical in my old age. But one thing is for sure, without a few dealers and without a few individuals willing to sell their old software and without the net, the Atari 8bit would have been dead long ago.

Never had a 600xl, but there's tons of RF modulators at local parts places.
I recognized some at probably 2600, not sure about the rest. Down the street
from Atari headquarters so they could have some. Give me the numbers & as
much dimensional numbers as you can. For instance, the only difference
I can see between a 1200xl RFM & a 5200 is the composite video jack on the
1200, everything else looks identical. HxWxL #of connection etcetera.

Source record: 89862

(Paraphrase: M. Current thinks R. Morris doesn't want to buy
commercial software he downloaded from xmission.)

Mr. Morris is from New Zealand. He said before that his
order to a US retailer for A8 software was not delivered,
but his money was taken. I don't believe there are any
retailers for A8 in New Zealand. The only Australian vendor
in my 4/94 Vendor list is Super Products vendor, but doesn't
mention any other products sold by this vendor. If M.
Current feels this downloading of files, some of which were
commercial, many probably were not, is piracy and
represents a loss to the A8 vendors and developers, then I
think he's mistaken. Mr. Morris probably would simply do
with whatever he could obtain elsewhere or write himself. I
would guess mail would be painfully slow, phone and shipping
would be prohibitively expensive for him.

I think billions of dollars of US software is going
everywhere over the internet and represents a significant
loss to the US economy. I don't think A8 commercial
software represents any part of this enormous loss. As I
said before, I suspect the availability of some older
A8 commercial software has resulted in a net increase in
vendor sales. This doesn't justify breaking the copyright
law. On this point, I'm not sure the availability of
commercial software for download is a violation of copyright
law. People own legitimate copies of much A8 software.
These copies are, in most cases, copy protected. It is my
belief that the owners of commercial software are entitled
to back it up and use the backup instead of the originals.
In many cases the old originals simply no longer function.
I do not believe there is any copyright violation for an
owner of a particular commercial software downloading a copy
from a BBS, ftp site, or getting it any way they can.

The US Congress is presently writing a new set of copyright
laws. Much of my uncertainty about software copyright laws
will probably be cleared up when the new law comes out.
Probably me and lots of people will not like the new law,
that's just the way I feel about new laws lately.

Arrggh! Our annual piracy flame fest! Has anyone changed their vote from the last 5 years or can we just assume none of us has changed their opinion?<g>
In a lighter note, as much as I'm in favor of protecting intellectual property. If Atari or DataSoft or <fill in the blank> ever showed up to harass James, I'd make the 1,000 mile drive just to sit
in the courtroom & complain to Atari my Asm?ed cartridge is broke, ditto for ROKLEN's GORF. My disks for both AR The City & The Dungeon need replacement also. Montazuma's Revenge went bad, but I managed to back it up myself otherwise Parker Bros should stear clear of the hearing.
Yes, James is in violation of the law, should take the copyrighted stuff off & just leave the choice stuff like MyDOS, ROTO, Burgers, & the shareware stuff like Sparta, SIO2PC, etcetera.
We have an odd situation here, the copyright holders will never file a lawsuit: While they can legally get the stuff off, they are not making money so they couldn't get enough in damages to cover court cost.
As Michael pointed out, the ones that will get hurt are outfits like B & C, they only have an inventory of products that is made less valuble by it being mede available free.
Once again, my standard nag, software is technology, it should be patented *NOT* copyrighted. Further, there is a limit on enforcing a patent, for instance, if you apply for patent protection & fail to to essentially upgrade it (usually through Continuation in Part or CIP for short) eventually your patent expires & you're left with no protection. What I heard was Atari did not get a nickel for copyright infringement in the latest rounds of lawsuits! Guess what? They had patents that covered things like 9 pin joysticks, scrolling, you name it. All of which were violated by Sega. Just doesn't pay to be an artist vs an engineer.

NEW ---- All Repair Shops are now listed here. ---- NEW

---- All Print and Disk Magazines are now listed here. ----

Additions/suggestions/comments/corrections are needed! Please send to:

Michael D. Current
URL:mailto:mcurrent@carleton.edu

Where to get the latest copy of this list:

The home of many FTP archives, automatically updated monthly:
URL:ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/vendev

The World Wide Web hypertext version, automatically generated monthly:
URL:http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/vendev/faq.html

"Flat hypertext" version:
URL:http://www.cs.ruu.nl/wais/html/na-dir/atari-8-bit/vendev.html

Usenet newsgroups where this list is automatically posted monthly:
URL:news:comp.sys.atari.8bit URL:news:comp.answers URL:news:news.answers

You can also send for this list by mail.
URL:mailto:mail-server@rtfm.mit.edu, message says:
send usenet/news.answers/atari-8-bit/vendev
quit

Finally, you can always ask me for a copy at URL:mailto:mcurrent@carleton.edu

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" shareware/freeware/PD developers should also be listed.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, public domain
software/freeware/shareware, (new) commercial software, used (commercial)
```

software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No product can be developed by more than one developer. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information is given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

I collect information for this list from wherever I can find it. While most updates to this list come from you, the user of the list, I'd like to recognize a few of the more prominent sources I use. Current Notes magazine, and their 8-Bit Editor Rick Reaser. Atari Classics magazine, published by Jim Hood and Bob Woolley. And The Atari 8-Bit Omnibus, published by David A. Paterson.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

1327. 600XL modulator

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-18 00:00:00 UTC
From: cmwagner@news.gate.net
Message-ID: <3uftcn$2bid@seminole.gate.net>
Source record: 89938

I complete a 64K upgrade on said machine, but before I even started it had problems with the RF modulator, I am wondering is there some place where I can order a replacement? It doesn't display any color, and there is a test point or wire wrap pole in the RF modulator, if I tap it with a screwdriver it will pick up the color signal. So the signal is there, but I suspect it is not be modulated. Can someone tell me or sell me a RF modulator for the 600XL.

My only other question is, after completing the 64K upgrade, will the memory test (RAW section) show 3 rows by 16 blocks? (is that representing 48K RAM, i.e. 1Kbyte per block, or is it arranged in a different manner?) I neglected to do a memory test on the 600XL when it was 16K, which I suspect it would only show one row. (Basically I am wondering if the upgrade was successful if I see 3 rows -- they were all the same shade of gray, which means they were either all bad or all good -- heh).

BW> appreciated. There was one text file that I thought would help, but
BW> guess what? Yup, 0 bytes after I tried to print it!

Boy, does that sound familiar! The doc.s for Sparta-DOS are being
sold commercially by Fine Tooned Electronics, definitely worth getting a
copy if you plan on using Sparta-DOS extensively.

There are two things that I know of that can cause zero length files
in SPARTA-DOS:

1.) *** USE OF A COMMA IS A DEFINITE NO-NO ! ***

Wrong! : COPY FILENAME.EXT,DEVICE:NEWFILE.EXT

...kiss your file bye-bye!

Right! : COPY FILENAME.EXT DEVICE:NEWFILE.EXT

...notice the single space character between file names.

2.) *** HANGING "OPEN" FILE HANDLE! TYPE "DIR" ! ***

I have been told that Sparta-DOS will not --CLOSE-- a file on an
end-of-input, end-of-file, on open channel condition (such as compiler
ERROR status under CC65 input control...).

Always! ALWAYS!... if you do --NOT-- see a prompt of --->

D1:

... --IMMEDIATELY!-- type -->

DIR

...and you will see an -->

ERROR 129

...at which point the drive will spin and do some directory
maintenance, closing open files, updating the directory, etc. After

this update it will then be safe to proceed. When using SPARTA-DOS,
I "DIR" after doing practically anything.

Also, you wouldn't happen to have an ATARI XF-551 drive would you ?
I have been told that SPARTA-DOS has been optimized for use with the
ATARI 1050 floppy drive under "ultra-speed", whatever that is....

P.S. Try to avoid the COPY command whenever possible. Use the external
programs XCOPY and XMENU for moving files around. Try to avoid
using any of the built-ins in favor of the external Toolkit modules.
I am a total novice when it comes to SPARTA-DOS myself and spent
the first month just creating and wiping files left and right.
There isn't a whole lot of error checking. "COPY D1:FILE D1:"
will destroy the file "FILE" in some versions of SPARTA-DOS.
It takes some getting used to to not clobber a file....
Maybe a real SPARTA-DOS user could offer you some better tips ?
Good luck!

Well, if you mean program PC's to get food on the table, then I confess
that to some extent I've "sold out" too <grin>

>
> You need to get yourself added to the Atari Vendor FAQ!

1331. Atari 8bit CD possible

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-18 00:00:00 UTC
From: JAMESK@mo.hba.com
Message-ID: <s00b692d.063@wise.net>
Source record: 89942

Replying to Simon Brownlee regarding the cost of creating a CD.

Geez! I should have kept this topic to myself. Not only do I get a handful of folks asking me to go into full professional production, but now I have this joker who thinks that 1) I'm getting ripped off or 2) I'm going to rip off others.

Its going to cost ME $50.00 per CD or less depending if I do more than 5-10 CD's.

I get charged something like $40 for the process and like $10 to extract the data from hard disk.

James King, jamesk@mo.hba.com

Source record: 89944

Hi, all!

I have some questions about Atari emulation on PC.
Explain me, please, how can i run Atari programms on PC. I think, that
i must have Emulation program and programm to read the information from
disks in atari floppy drive format. Where can i get this stuff?
Or it is more sophistically? Correct me.

Thanks for answer.

Source record: 89946

jeking@xmission.xmission.com (James King) wrote:

>I'd like you all to describe your Atari computer setup. What
>peripherals, device, odd attachments does it consist of?

My setup consists of:

600 XL 256 K
800 XL (stock)
800 XE (stock)
130 XE (stock)

1050 diskdrive - USdoubler
1050 diskdrive - Super Archiver II

1027 Printer
Centronics interface to inktjet

2 1010 cassette players

I'm planning to upgrade the 800 XE to 128 K, it requires only two
extra memory chips and a PAL-chip.

Hello,

Is there anybody who can give me the resistance value of an atari
paddle controller (Ohm) ?

Thanks,
Thijs

Thijs Aaten

: : this nonsence. (please don't explain)
: What is wrong with a Zip thread? They should be usable by the Atari8, right?

As Keeper of the Zip FAQ, I take responsibility for the posting of the FAQ here. It was requested by several (okay, three) Atari 8-bit enthusiasts.

The Zip *DOES* work with the 8-bit Atari; I've successfully tried it with an 800XL, Black Box, and SpartaDOS. SpartaDOS sees it as a plain old hard disk (well, it sees it as several ~16-MB hard disks, but you get the idea). SpartaDOS will format the Zip cartridge; there is no write-protect ability for the entire cartridge/drive partitions, but you can lock and unlock individual files.

I haven't done any extensive testing as my Zip is attached to my Macintosh (where the storage is needed more). However, the posting of the FAQ was, I believe, valid here. If the population here would prefer to not have it posted (the next version is due by the end of the week) say so and I'll take it off the thread.

ISO9660 is the industry standard, not the PC standard. Rockridge is also
an extension to the ISO9660 standard (which seems to be designed around
MS-DOS) which allows longer mixed-cased filenames for *IX type systems.

I am not sure what Rockridge is actually called, it maybe be ISO9660-1, I
don't know. But it is a standardized method for having larger filenames,
which should work fine for Mac systems, afaik.

1339. Atari WWW Museum?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-18 00:00:00 UTC
From: cecarman@miavx1.acs.muohio.edu
Message-ID: <1995Jul18.020442@miavx1>
Source record: 89950

I've been perfecting my html-writing abilities, and while I've been doing that, I've been thinking about tons of different web pages that would be neat to do.

What about an Atari 8-bit WWW Museum? Pictures of every Atari model (I think there are already available at somebody's web site), pics of all the peripherals, the FAQs available here, links to all the FTP sites, screen captures of different software things like DOS and popular programs (I can do this with my AV PowerPC attached to my Atari 800 for a lot of things), whatever... Is there something like this that already exists? If not, I'd love to put it together with cooperation from this newsgroup (I only have the 400, 800, 810, 830, 850, and 410 as far as peripherals go).... not so much an Atari homepage, but a museum of 8-bit things (with stuff that people could contribute about each computer type, peripheral, etc). What do you all think?
Later,

If you run the memory test with Basic turned off (hold down the Option
key while turning on the computer), it should show 3 rows of blocks.
With Basic turned on you will see only 2 1/2 rows of blocks.

The 1090 was an expansion box that would have connected to the 800XL
parallel bus and accepted plug-in cards. It was rumored that they would
use IBM-compatible cards.

Russ.Gilbert@apk.wariat.org writes:

>I'm presenting a 'second' opinion about possible commercial
>software on the xmission site. I suppose this is mostly a
>post to M. Current, but I want it to be public.

Nothing "possible" about it, there are dozens of commercial software titles
on the Jim King/XMission Pirate FTP Site.

>point is, the putting up of commercial software on an ftp
>site was not deemed illegal in this particular case. Mr.
>King is himself a system administrator.

I believe you're correct, simply making pirated software available is not
illegal. You have to be taken to court by the copyright holders of the
pirated software. In this case, there are dozens of people/companines
whose rights are being directly infringed upon, including Atari, Nintento,
Sega, LucasArts, and MicroProse off the top of my head. Whether XMission
and/or Jim King wish to make it easy to be taken to court by all those
people is their choice, indeed.
(Atari could always use some more cash from winning another court case, ask
Sega.)

Whether Mr. King himself is a system administrator is immaterial, although
I don't believe he helps run XMission.

> Commercial software for the 8-bit is often not available,
>or it is available but in protected versions. There are
>many people who own legitimate copies of ancient or newly
>bought A8 software that would like to have a backup or
>'image' capable copy. The commercial software I saw on

>appreciate the xmission ftp site, never downloaded from it.
>I think M. Current is being incorrect in thinking Mr. King's
>provider will substantially care about the ancient
>commercial titles available on xmission. I do think the
>hassle and expense will cost A LOT of people this site.

Most commercial software for the 8-bit IS avaiable through commercial
sources. Just start calling vendors, you'll find most titles you've heard
of are out there. And you'll find nearly all the pirated titles available
from Jim King/XMission are available commercially.

The need for archival copies of legally obtained software is legitimate.
Copyright law allows for it. That's why there are commercial products for

archiving copy-protected software. But I doubt everyone getting their pirated software from Jim King is doing it for archival purposes. No, they're grabbing the stuff because it's free, and they don't have to pay any of those nasty 8-bit Atari vendors for stuff they can get for free from Jim King on XMission.

The pirated software he's making available does appear to be mostly older titles, as you say. Titles available commercially from American Techna-Vision, B&C ComputerVisions, Best Electronics, Toad Computers, Video 61, etc., etc., etc. Why should we support them? We don't need them anymore. Is this the prevailing attitude around here nowadays? Are you developers feeling better about releasing new commercial software?

> Anything that decreases the sales of
>today's A8 retailers and discourages new development is also
>costly to this A8 community.

I couldn't agree with you more.

: I'd like you all to describe your Atari computer setup. What
: peripherals, device, odd attachments does it consist of?

Alright, Here is my MAIN comp: im sure to miss a few!!

130xe -> 320k with 4 OS switch, Original, Omnimon, Omniview, BOSS XL
MIO 1.1 1MB
2 40MB Hds (2nd as backup) on an adapted 4000a controller
4 1050's : 1 Happy, 1 USD, 2 permanent write.
14400 Modem, 2400 modem, XM301 Modem
1010 tapedeck
a BOX of about 30 joysticks I got for $7 :)
Atari trackball
Atari XE Lightgun
Paddles
Koalapad
Zenith Greenscreen monotor and external audio amp for main work, and
colour tv for games and demos :)
130XE -> 320K
800XL -> 2 OS's - Original, Boss xl
SpartaDOS X 4.21
R-Time 8
Assorted original games on tape, disk and cart.
some on tape: Synapse games like Pharaohs curse, Shadow world, Slime
on cart: Flight sim II, Bug hunt, (i have 13, cant remember all!)

: In addition, mail me a photograph, and I'll get it scanned in and added
: to a web page.

There is a pic of me on my homepage :)
http://www.wimsey.com/~johng/ryan.html click on my photo album..

I am also a registered PRO! sysop, and have a BBS ready to go... its just
that I really dont know if there is going to be lots of people calling a
2400bps board in Canada??

Anyone yays out there for me to get my ass in business and put the bbs
up? Just gotta press the buttton!

1346. Re: Yamaha video chips

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-19 00:00:00 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <RrPgYFg.lmcclure@delphi.com>
Source record: 89868

In a message dated 7-13-95, Brent Buescher said:

"They are based on the TI video chip in the TI/99, Colecovision,
and MSX computers and were originally developed by yamaha for
MSX-II or MSX-III or somesuch."

The U.S. TI-99/4A's used the 9918, while I believe TI-99/4A's sold in Europe used the 9928. (The main difference between these two was how the output was encoded...plug a 9928 into a U.S. TI and you'll get a nice 16-greyscale output. Add some additional decoding circuitry, and you could get nice, crisp, analog RGB. The Colecovision and the Coleco Adam computer used the 9928. I lifted a 9928 from a surplus Adam video board to put in one of my TI consoles, but never got around to putting in the mod for analog RGB. However, I traded my NX-1000R for a TIM board which has a 9958, so there is not much point in doing the mod now. <grin>

The 9938 first appeared in the MSX series in the MSX-2 machines. The 9958 was used in the MSX2+ series and the Turbo-R (the pinnacle of the MSX series).

"I think the third party super TI/99 (don't remember the
name, I just had a friend who was a TI fanatic) which was
pretty snazzy for its day (back when Amigas and STs ruled
the earth) used one from that series, probably the same
one as the Sega Master Console."

That "super TI" would be a Myarc Geneve 9640. They have a 12Mhz 9995 CPU, 512K standard RAM, use a PC keyboard, a 9938 VDP, and fit into the standard TI PEB for I/O support.

I have heard more than once that Sega used the 9938 or 9958, but if so, they severely limited the capabilities of both, as even they 9938 is capable of better graphics than you see on a Sega Genesis.

"Does anybody know if they support external video through
like the original TI chips?"

While I cannot say for certain, I would be surprised if they don't.

BTW, there is another chip in the Yamaha 99xx VDP series...the 9990. However, unlike the others, it is not backward compatible with the previous chips. Although this would be nothing of concern for use with the Atari 8-bits, I also understand its pricing is not very competitive with other chips of similar capabilities.

>King's Pirate FTP Site?"

Sorry - I didn't see my typo at first - make that, I've _lost_ a lot of
money that way - I certainly wouldn't mail order any computer stuff anymore,
I'm sick of being ripped off!!! And also, quite a lot of the stuff I ftp'd
is also available at umich - I thought things like later versions of Sparta
DOS were not commercial? I thought I had seen something in the docs about
being released into PD or thereabouts - I don't deny I grabbed a few games
aswell, though.

And there aren't _any_ Atari vendors that I know of in New Zealand - so how
can I buy the stuff? Without getting ripped off by mail order companies
that is.

Richard.

: >>As far as I know, it, along with the 1400XL and 1400XLD were vaporware.
:
: I've got a couple of 1400XL's here at FTe...
:

OH yeah? Well I have a few $$$ here for one.

And the 1450's had DSED drives eh? So...how come no one has slapped
one into a 1050 drive? or...why hasnt anyone put the logic from a 1450
floppy board on a card and hooked it up to an 800xl? (eproms and all?...)

: There is nothing really vaporware about them, except that they didn't
: go into full production. 4-layer motherboards, custom power supplies,
: plastic injection molding, the works!!

4 layer? I thought they were 3. And are the roms split up in half
like the 1450's? Why were the 800xl and 600xl one chip yet the 1450
seems more like a super modified 1200xl...they even use the same MMU
...also why don't the 1400's have L1 and L2?
:
: I think that they would have been way too expensive to manufacture, and
: Atari was probably better off by dropping them. The 1090's on the other
: hand, should have been released.

Yes, of course..which revision are you refering to however?
The idea of having a special serial card so the 400/800 users can put
a 1090 to use was a great idea!...however, it seem that Atari kept down
scaling the 1090 from 8 slots to 5...from High speed modems and harddrives
to 80column cards and hacker project boards.

Now, one final note... I would love to OWN a working 1450XLD before I
die...or atleast get to old... I would love the cases (just the cases)
to ANY 14xx series... heck even a straight 1200 (not xl) would be nice..
and some 815's.. heheh etc... =)

(Speaking of 1200XL's..does anybody actually have a 1200XL with the
1200XL OS and not the 1200 os? All mine are 1200 OS.)

:
: . Mike(FTe)

Karl, thinking of how DAMN nice it must be to be have "a couple" 1400xl's.

Go for _Mapping_The_Atari_XL_Edition_ as a WONDERful reference.
_De_Re_Atari_ is also a great explanation of a lot of stuff and is good
with theory.

An excellent (looking- I haven't tried yet, don't know 6502/65816 yet!)
assembler / debugger (6502 only for debugger at the moment) is John Harris'
"MAE 95" available via FTP (atari.archive.umich.edu/atari/8bit).

There's also the _Complete_And_Essential_Map_ which, I've heard, isn't TOO
much more than Mapping The XL rewritten.. of course, I think Mapping XL
NEEDED to have been rewritten from the start! I mean, taking the old
Mapping and simply adding the XL stuff (and corrections) to the END!?
Tsk tsk..

But oh well.
Hmm.. I still need to get _Complete_ one of these days.. (and some 6502
and 65816 assembly books!!! :))

Although pirating A8 software doesn't hurt the US economy or general
software industry very much / at all, you must remember that the A8
vendors are VERY fragile.

I myself would, if I ever get around to writing SELLABLE software ;) ,
NOT attempt to sell it! I could be pessimistic, but I think I'd get
at best a very small handful of purchasers.

Of course, if I ended up making some huge multi disk or CD ROM based
(hey, it might happen! ;)) game with a lot of animation and digital sound
and video taped acting sequences and ray traced images and stuff, then
I might consider it.. but hell, Geneocide (which is more or less going
to contain all of that) is going to be FreeWare, so.. :)

Due to a very severe verbal scathing by Michael Current (via Email), I've decided to pull the plug on my Xmission ftp site.

No, I'm not going to randomly go through and attempt to remove select files to make it "politically correct", but am going the more severe route, which is to remove the entire FTP site altogether.

Why should I continue to pay $25-35/month just to get barraged with comments like:

Michael Current: "Most to all (sic) of which remain available commercially (until you and your kind finally put the remaining 8-bit Atari vendors out of business). (sic)

I took personal offense at that remark - indicating that _I_ was somehow personally responsible for the collapse of the 8bit Atari.

Not only have I strived to provide as much 8bit Atari support as possible (SysOp of Delphi's Atari 8bit area, Sysop of the Atari Connection BBS, maintainer of the Xmission ftp site, frequenter of the Pro!/USF networks, frequenter of the FidoNet (had to call long distance to keep in touch there), frequenter of the Carina net (another long distance call), and purchaser of EVERY (NOT just a few, but EVERY) 8bit title available from B&C, American Technavision AND Toad computers - let alone all the stuff I've purchased from FTE, CSS and all the small developers (Daisy Dot III, Textpro, Colorview, Small Business Systems, etc..)

In addition, I've answered EVERY peice of mail directed at me by newbies and those looking for help!

Oh, and dont let me forget about the couple of weeks I spent working on M. Currents 1meg XE, just to be "beaten-up" about that as well -- as if I had somehow marketed myself as an 8bit hardware expert to begin with. I offered to examine the 1meg, because I've built several myself, but couldnt resolve his problem, then offered to look at it just for the cost of shipping and any parts I had to purchase. Oh well, that's the price of being somebody who doesnt care about the 8bit world, eh?

To be called a pirate is a heinous insult indeed, especially coming from somebody I had respected previously (Michael Current).

Oh well, enough of my lecturing. I guess I just needed to get that all off my chest. I thought I was doing pretty good supporting this orphaned machine. Maybe its finally time to call it quits and stick with my 486/80 permanently! It is what I make my living on, afterall!

I'll answer the question about why no one stuck a 1450XLD drive into a
1050. They are IBM style drives and actually use an 8031 micro to interface
between the 6502 & drive circuitry. Probably a little closer in design
to a buss oriented XF551 then a 1050.

To this, I have to reply. I spent over four weeks working on his machine trying to figure out what was wrong with it. At the start, I knew nothing about the hardware of a 130XE. Now, now I more than I wanted to know. I would think that as someone who has built hardware upgrades, you'd know how to read the schematics for the motherboard, and wonder why the data input from his Newell board was wired the way it was. (Aside: Yes there is a rather large mistake in the directions. Data bits 4-7 wire-pin connections are reversed for the antic chip) Did you not wonder why the original directons he sent you had that marked? Not even as you were blindly following them? You want to care about the 8bit world, then learn a bit about what you're trying to do before doing it. Sheesh.
Oh, I could go on, but frankly, it's not worth it.

The poster of the question about hooking up a 1450XLD style drive to an XL
may also not be aware that CSS (Bob Puff) has the great floppy board add on
for the black box, which lets you hook up IBM style drives to the PBI.
It's not in any sense derived from the 1450XLD technology, though.

I'll give this a shot but I'm sure I will forget something laying
in the back closet.

320K XE
1 Meg MIO (Upgraded from 256K with 8-1 Meg DIL RAMs.)
40 Meg Seagate Hard Drive
XF551 with Dual Bob Puff upgrade (Presently not in use, no room)
1050 with Super Archiver and BitWriter (In use)
2400 Bauc Ataptec Modem
Epson LX-800 printer (Panasonic KPX 2123 if needed).
ComputerEyes Video Digitizer
SDX, R-Time8, EXPRESS! Cart.'s

Other equipment, not in use: (and Not for sale)
2 - Indus GT Disk Drives
3 - 810's, 1 with a Happy
800XL with 256K RAMBO
Several 800's
Couple of 48K 400's, 1 with 'B-Key' keyboard
Roller Ball Controler
Joy Stick Compatible Mouse

This is by no means all of my Atari equipment. I also have a
1040 STe (4meg) and a FALCON 030 4/85, both with large SCSI Hard
Drives and extras.

From: toastman@armory.com
Message-ID: <3ujoq3$b7a@news.scruz.net>
Source record: 89887

Well I've come across two assembler programs on the xmission site. one is mae_94, and the other is qassembl. Qassembl looks nice but it's all in Polish or some other slovic language. Is anyone translating this to english, or sdoes someone have a brief doc file written in enough english so that I could try to use it, or should I just get another assembler?

(The QA.COM itself is in english but most of the source and some of the other .COM files are not.)

Sounds like a good idea to me. I particularly like the idea of screen captures that could be used as wallpaper in Windows. DOS (hey, anyone else still use the 2.6 version?) and popular games (Mule?) would be great.

Good luck on your venture.

1369. Atari 8-bit stuff -- FOR SALE/TRADE

updated 07/16/95

I have the following Atari 8-bit computer equipment for sale or trade.

Everything is sold as is. Unless specified, all items have been tested and are in perfect working order.

Buyer has ten (10) days to send payment, and pays all shipping costs, which will be sent via U.S. Snail. The shipping cost depends on both the weight of the package and the distance that it is traveling. The buyer has the choice of either first class or parcel post (slower, but cheaper).

Payment must be made in U.S. funds, by either check or money order, drawn from a U.S. bank branch. Canadian buyers must send a Canadian Postal Money Order, payable in U.S. funds. This is the only way I have found to deal with my friends to the north (my bank is very picky, but the U.S. Post Office will cash a Canadian Postal M.O.)

* = (after price) Tentatively sold/traded. Inquiries welcome.

*****

LOT #1

ATARI 400 COMPUTER with RCA cable, and 410 Data Recorder.

This is a complete system, except for RF switchbox and power supply.

$14.00 *

Hi folks,

I just stumbled upon this newsgroup. I still have an old Atari 400, and 1200 XL, two 1050 drives, and a bunch of floppies with software collecting dust in my closet. I was tempted just to pitch the whole thing...but from what I read here, there is still an interest in these old dinosaurs. Is there anything useful I can do with these machines, except for hooking them up to my TV to play (occasional) Star Raiders?

Jim

I have to agree. I have strong beliefs against pirating, and have about 100
or so PC programs I have purchased. I do have a couple that I did not purchase
because they were *no longer available or supported*.

I feel strongly we should support the Atari vendors still out there, but
truthfully the majority of the software they now have in stock were
close-outs, buy-outs or trade-ins from us. The availability of old software
for the Atari is one of the attractions of going back to it. Nostalgia gets
you hungry for all those old games, as well as the feeling of sitting down to
program and make something happen in front of you. I was looking for a
program that was listed as being available in catalogs, but was not when I
called. I found it on XMission. Is this wrong or pirating? I don't think so.

Principles are important. I feel strongly about many things, but in this case
I don't feel there is justification for forcing personal views on
others. Piracy is responsible, in part, for the closing of many software
houses, and while I did it 10 years ago when I first had an Atari, I now
regret it and would not do it again *if* it would have an effect on the
programmer or software publisher. However, this is no longer the case.
IMHO.

>The discription:
> High-Speed, +5V Pwrd, Dual RS-232 Transmitters and Receivers
>The part number is MAX232ACPE-ND, the price is 4.32 for one.
>
>Now, for those who know about these chips, there's a version of this
>chip that doesn't say high-speed, and is cheaper, but I wonder if it
>would work at 19.2 kbps.

From the MAXIM book:
max232 - 20Kbs (Should work ok on normal length cables)
max232A - 116Kbs (Use this for the logn distance transfers!)

You should check out JDR Microdevices 800-538-5000 (In San Jose CA):

max232CPE - $1.99

They also have a part: max233CPP Desc: Max232 with no external parts required
for $5.39.

Call them and get a catalog!

1374. Halle Project 1993 Demo & Peter Dell

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-19 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <199507200106.SAA16665@zippy.sonoma.edu>
Source record: 89896

(sorry if this gets posted twice)

Ok, Peter Dell is a name I recognize, and I think it's from this group.
I'd like to say to you, Peter: VISDOM PART 2 RULES!!! :)

Ok, anyone who has seen Rzog Plazma from ... damn, I can't remember, either
"Sweet Illusion" or "Bitter Reality" will probably agree that that's one
of the NICEST looking wiggle plasmas around. (Not as true a plasma as
many of the others there are, like the two from Cool Emotions, but very
fun to watch none-the-less.)

Now, what Peter did with his demo, VISDOM II - the last demo on Side A of
the Halle Project 1993 demo disk (unfortunately you need PAL to see it
though!) - includes the following:

(1) a big 160x192 resolution logo saying "VISDOM" at the top of the
screen. Each letter is composed of an outline (two shades of white)
and filled with many shades of a color. Each letter (6 total) is
filled with a DIFFERENT COLOR. That's 6 moving shaded colors, plus
2 outline colors, plus the black background. That's 9 colors per
scanline in 160x192 mode! WOW! (I know how it's done though ;)
Dog biscuit to whoever figures it out :))

(2) A nice, large four color scroll line at the bottom (actually, it does
that metal effect many scrollers do where the top half is one set of
shades and the bottom is another). (Easy DLI trick + VBI scroller).
It's also a long (and multi-speed and color-changing) scroller! :) :)

(3) In the middle... this part is the great part.. It starts out blank,
the goes to white, and then this wiggley image appears. It's
comparable to Filet Lazma from (Sweet or Bitter.. I forgot again)
but with 16 shade graphics, like Rzog Plazma.

BUT!!! The LEFT HALF IS ONE COLOR (16 shades) AND THE RIGHT HALF IS
ANOTHER (another 16 colors!) And this is a dynamical, wiggley-shaped
image!

WOW!!!

Anyway.. GET a PAL ANTIC chip. Plug it in, fix your Vhold.. screw the OS
fix for now, and BOOT UP HALLE 1993 AGAIN! :) See what you missed the
first time!!!! :)

Peter Dell is COOL!

Oh yeah, and the middle changes.. and has a cool help screen too! :) :)

Anyone got a copy of VISDOM I ? I wanna see it!

-bill!

There's a good assembler called kasm in the umich ftp archive. If you
can't get onto umich, try
ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit
I tried mirrors.archive.umich.edu; first I got a site that only mirrored
the Mac files, then even that was too busy to connect.

1381. Re: ML Assemblers

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-20 00:00:00 UTC
From: Michael Ellis <michael@anest4.anest.ufl.edu>
Message-ID: <3ulm3a$i8e@no-names.nerdc.ufl.edu>
Source record: 89811

Probably the best way to begin programming the 8-bit Atari is in machine language with the following products:

* OSS' Mac/65 Assembly Language Cart
* Mapping the Atari (revised edition) by Ian Chadwick
* De Re Atari (been out of print for years and I'd kill for a copy)
or
Your Atari 400/800
* Atari OS Programmer's Reference
* Machine Language for Beginners (compute! books) -- contains description of the 6502 instruction set and addressing modes

It may surpise you to know that the 6502's register set looks as follows:

```
BIT #
7 6 5 4 3 2 1
-------------
Accumulator | | 8 bits wide
X register | | 8 bits wide
Y register | | 8 bits wide
Stack Pointer | | 8 bits wide
-------------
F E D C B A 9 8 7 6 5 4 3 2 1
-----------------------------
Program Countr| | 16 bits wide
-----------------------------
```

Yes, the program counter is the ONLY 16 bit register.

Q: So how does the 6502 manipulate the stack with only an 8-bit stack pointer?
A; The stack's range is fixed from $0100 to $01FF. It defaults to $01FF at RESET and counts down -- it pushes the byte and then decrements the SP.

Obviously this means that you are limited to a non-relocatable, $100 byte stack -- that ain't a lot.

Hope this helps...

-Michael Ellis

There's is no commercial software on Merit/UMich. In particular, you're correct that SpartaDOS 3.2f and 3.2g were released as shareware by Fine Tooned Engineering.

>And there aren't _any_ Atari vendors that I know of in New Zealand - so how
>can I buy the stuff? Without getting ripped off by mail order companies
>that is.

I'm sorry that you've been ripped off, I'm sure not every vendor is a saint. My suggestion: Report them, spread the word about your experience...and try another vendor! Surely you haven't been ripped off by all the mail order vendors yet, and I hope most would give you fine service.

There's lots of commercial software available in Europe. Since I don't feel like mail-ordering from Europe, does that give me a right to get pirated copies of those titles? No, the US is part of the Berne Convention (international copyright treaty) just like everyone else. If I want those European games, I'll have to either "risk" mail-ordering them from Europe, or wait until someone like Software Infinity, Trans World Exchange, B&C ComputerVisions or Best Electronics imports it here. Why should these vendors import European titles if they are going to be made available on pirate FTP sites?

Richard, I hope you'll try another mail order source, and by all means avoid the one(s) you've been ripped off by!

1386. Interested in NEW ATARI 8-bit OS?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-20 00:00:00 UTC
From: michael@anest4.anest.ufl.edu
Message-ID: <michael-1907952034380001@dialup-c3.cis.ufl.edu>
Source record: 89816

I have a design for a new 8-bit OS and am writing to see if anyone would
be interested in this.

Here are some key features of the design:
* multitasking OS
* support for 256K RAM
* pseudo-virtual memory
* provides multi-application I/O control of CIO and the IOCB (for maximum
compatibilty with 3rd party hard disks, modems, etc.)
* different screen drivers (ANTIC MODES: 02, 0E, 0F and possibly GTIA)
* each application gets a virtual 64K of (banked)RAM to use

The primary limitation of this design is that it will NOT run existing
programs. Applications will have to be written in a manner that is
compliant with the
OS. I don't see this as a bad thing, however, since current (current=past
;-)) software basically TAKES OVER the computer anyway.

Any thoughts?

-Michael Ellis

You could check to make sure the head is not damaged. Also, there is a pad on
the arm above the head that comes off sometimes. If it's off, then the disk
does not make good enough contact to write.

My CURRENT Atari 8bit setup consists of:

576k XE
256k MIO
800megs of hard disk space (divided between 4 hard disks)
ATR8000 with 3.5"and 5.25" floppy drives
Happy 810
XF551
Happy 1050
820 printer (dedicated label machine)
Commodore 1702 monitor
XEP80
Magnavox 80 mono monitor (for XEP80)
Hayes Ultra 14.4 modem
IBM ProPrinter II
SIO2PC 3.19 connected to my 486/80 16meg Ram, 1.2gig hard disk(s),4 x CDROM

My FAVORITE system consists of: (currently stored in my shed)

1 x Stock 800 (CSS MUX Master)
1 x XEGS (Mux slave 1)
1 x 256k 800xl (Mux slave 2)
1 x 576k XE (Mux slave 3)
2 x 256k MIO (one with 500megs HD, one with 300megs HD)
2 x Hayes Ultra 14.4k
1 x PR:C (slave 3)
1 x ATR8000 (slave 2 w/MIO)
2 x Commodore 1702 monitors (slaves 2,3)
1 x Standard composite color monitor (master and slave 1 - switch boxed)
1 x IBM ProPrinter II
1 x Star NX1000 (dont I still owe somebody $10.00 for that?)
1 x 850 interface (slave 1)

and of course slave 2 connected to my PC via SIO2PC

James> I'd be greatly interested in the new OS - seeing as how all of
James> my 8bit hardware consists of upgraded devices (RAM, 800megs HD,
James> etc..)

I've thought long and hard about whether it would be worthwhile to start putting together a unixish OS for the eight-bit and have basically come to the conclusion that I'm better off in every way running linux on a PC and using the 8-bit for 8-bit stuff.

BUT it could be kind of cool to have a multitasking OS with virtual consoles, etc. running on an 8-bit.

I think the way to do it would be to hack the virtual machine that executes the pseudocode that the small C family of compilers (cc8, ACE C, Deep Blue C, and another whose name I forget) use to include memory management and other nice features that a multitasking OS would need and then write the OS on top of that. That way we could make banked, and possibly also virtual, memory look flat to the pseudocode as well a potentially being able to support pretty much any expanded memory scheme. Additionally, the virtual machine could be rewritten for the 65816 (and flat 65816 memory) for a significant performance increase. The biggest advantage, though, would be having high-level language support from the beginning so that small unix utilities could be easily ported. The disadvantage is that performance would be mediocre, though I've been pretty satisfied with using cc8 for small projects.

Brent

>what I read here, there is still an interest in these old dinosaurs. Is
>there anything useful I can do with these machines, except for hooking
>them up to my TV to play (occasional) Star Raiders?

What, Star Raiders isn't a good enough reason by itself to keep
the ol' Atari around? :)

Seriously, Atari 8-bits can still do the things they always could:
you can do your word processing on them, you can do spreadsheets and data
bases, you can play games, etc. They're real computers, and there is a lot
of software available for them at a low price.
And, if you download FlickerTerm-80 or ICE-T (I prefer the former),
you can do your telecommunications on them in 80-columns, with ANSI or
VT-100 terminal emulation.
I use computers a LOT, and I do everything I use computers for,
except run my BBS, on my Atari 8-bit.

check the FAQ and the Vendor/Developer List (posted here regularly)
for more information on what can be done, and where you can buy additinal
equipment and software.

I do hope you keep your 8-bit around, and discover all you can do
with it.

No, Dilbert's Scott Adams is not the gaming Scott Adams. However,
Dilbert's Scott says that if anyone knows where the old Scott Adams is,
he has a lot of misdirected email for him! :)

Scott Adams (the Dilbert one) has a wonderful Web page set up through
his publisher, which I highly recommend. It's called the Dilbert Zone. I don't
have the URL handy, but do a YAHOO on Dilbert and you'll find it. There
is an archive of recent strips, a history of the development of Dilbert, and
a bunch of stuff by Adams about himself, how he works, and what his life
is like. The above info on the gaming Scott Adams if from his FAQ.

You are using the single RCA jack in between the two DIN plugs right?
If that's what you're using, then you do have a problem. If the monitor
cable that came with the 800XL is a 5 pin DIN cable, then the output is
for a composite monitor. You can run this into your VCR video inputs or
if your monitor/tv supports it, into the RCA jacks there. IMO you get
a much cleaner signal from the composite into VCR then going through the
antenna/switch box.

I've got one of these. Very interesting drive and very professional. I
had considered selling it about a year or so ago but now have decided to hold
onto it because it is unique. Too bad the 3" disks are impossible to find...

I am new to this group but I was(am?) an Atari user from way back...
But anyway I got some 8-bit stuff Id like to get rid of:
1 65XE (Doesnt work) $10.00
1 130XE with selectable 392/190KB memory an RS-232 port and a custom interface or controlling devicies(I used mine for robotics)
2 1050 Disk Drives
Tons of soft[A
[C[C[CTOns of software all of it including a CAD program for 130XE's only.
$20.00

OOps I left out the prices for the 130XE and 1050's
Trick 130XE - $50.00
1050's - $10.00 ea.
I will haggle on all prices.
contact me at:

If you have a 130XE or expanded 800XL (128k) you should definately check
out mae_95! or wait a week or so until I put mae_96 up there.
If you have access to a postscript printer there is also a postscript version
of the manual there ready for printing, (similar content to the original
text-only doc's but in my opinion easier and more comprehensive to read.)

Oh, if mydos is your only game you could also check out a german macro-
assembler called 130+ if you are confident in understanding german.

Personally, I don't have a use for an OS that can't run the
existing apps. I mean, I already have that on my IBM clone, which is MUCH
more powerful than the Atari could ever hope to be. When I use my Atari,
I use it because I like what it is. I don't need a new CPU or OS or video
chip or any of those other things that people talk about but which would
fundamentally alter what my computer IS.

When reading the stepper motor does work as expected. It actually reads
and boots fine, but when trying to write it doesn't.

1415. Help get my son online (so he'll write!)

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-21 00:00:00 UTC
From: dabell@wco.com
Message-ID: <dabell-2107951643500001@merc25.calon.com>
Source record: 89837

Our older son, a recent college graduate, lives on the other side of the country from us (we're in CA, he's in VA), and the only way we can possibly get him to write letters is to get him online. I know this because he used to write us regularly via his now-dead college account. He has a 1200XL and I can also give him either an 800XL or 120XE (or both! What the hell...). He also has a 1050 disc drive (and I can give him two more), a printer, and that's it. No modem presently, and, of course, no communications software.

Okay, here's the deal. I'm willing to get him outfitted, but I need some guidance. (This should be a little familiar to Bill Kendrick, as I originally discussed this with him.)

First, does it matter which of the three computers he uses? My recollection is that the 1200XL actually had a modem port, but I'm not sure. (Or was it the 130XE? Hmm.)

Second, can I buy just about any modem on the market and be confident that it will work, so long as I have the right cable? And what IS the right cable, by the way? RS-something or other, right?

Third, I've followed the discussions and downloaded the latest FAQ, which I have printed up and will send him, and get the impression that Flickerterm 80 is the comm software of choice, although I guess BobTerm and Ice-T have their partisans. Anyway, whichever I get, just *how* do I get it without already having the modem and software to download them? I can get it on my Mac, but then what? I don't recall any Mac emulators for the A-8. Can the software be obtained on disc? If so, how? Here in the house, we do have an Atari 8, a Mac PowerBook with an internal modem and an external modem which my younger son uses with his ST. Could some configuration of those end up with the comm software on a floppy?

Fourth, which online service is most A-8 friendly? It seems like I see more Delphi and Genie addresses than others (at least of the commercial services).

Fifth, are there any other pertinent questions I have failed to ask?

I am receptive to answers to any or all of the above via email or here. I hope to hear from someone. Assuming we get it together right, I expect you will soon have another member on this forum. (Although you'll also have one less, probably, that is, me.) Thanks for reading all this and contributing to the togetherness of a far-flung family (violin music swells in the background).

Alan

(posted and e-mailed)

Alan! A few things:
(1) WHOA! You're in Santa Rosa! DID I KNOW THAT!? I'm in Novato!!!
(2) Heheh.. wco.com.. West Coast Online. I saw some "flyers" put up in
Rohnert Park by a very UNsatisfied customer. :) (It started with:
"Thinking of getting an Internet account? Then don't go to WCO!" :))

Now.. to answer your questions:

(1) None of the Atari's had built in modem ports. The 1400XL and 1450XLD
had built-in modems though (ooh, 300bps! :)). See #2:
(2) You can get just "any modem", but stick to a 14.4k or slower, since
we can't go any faster than 14.4k bps (and most modem interfaces
barely keep up with that, if at all! 9600 is usually the safest, most
trustable speed you can get with most less-expensive interfaces).
Oh.. you'll need an RS232 interface, like an Atari 850 or
ICD "P:R:Connection". Others, like Black Boxes and MIOs are also
hard drive interfaces and are much more expensive.
You might want to give him the 800XL too, to be safe.
(3a) Yes, FlickerTerm 80 is so far the fastest, but it flickers.
That might get annoying, or it might not. It has the advantage of:
again, speed; and a bit wider font than IceT or other 80col. terms.
But, IceT is great for 9600 so I've heard, doesn't flicker.
Both have their advantages over each other, but they seem to be
gradually turning into very similar programs.
BobTerm is becoming less and less useful, but is about the best
program to do file transfers with, unless you are forced to do Kermit
protocol (vs. Xmodem, Ymodem, etc. protocol) transfers. DON'T do
Kermit transfers unless you REALLY NEED TO! They're HIDEOUSLY slow!
Oh, the program for doing Kermit is called "Kermit" :).
(3b) Getting the files from the Mac to the Atari may prove difficult.
Find someone willing to mail (via post) a floppy disk with, say,
MyDOS 4.53 (DOS of choice for many) or SpartaDOS 3.2* (DOS of choice
for the other half) and all three or four terminal programs (INCLUDING
DOCUMENTS! or have them print the docs for you).
(4) Dunno which online service is the friendliest, but (for now >:^))
steer far from America Online and Prodigy, as they use graphical
interfaces which require special software- and they only provide
it for MS-Windows and Macintosh. <sigh!>
(5) I don't think so! Good luck! Oh - one thing, maybe we can get
together some time - there're a few other 8-bitters (some not as
active as others) up here: Ben Corr, the guy who made that Genlocker
(ALWAYS forget his name!!!), Cameron Tully-Smith, Carl Bevil, myself.

Again, good luck!

1418. Modifying Atari 8-bit Systems

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-21 00:00:00 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <5PAioJ0.ransom22@delphi.com>
Source record: 89840

Thanks to James King's question of what each of our Atari systems consist of, I've gotten a better feel for what people use. Although many people included things NOT in their currently used system, many of the rest were much more than I'd expected.
You see, my system is very much "bare bones" in comparison to those. None of my hardware is modified. For the most part, I like it that way. The only thing I'd really like is a bit more RAM (at least enough to set up a RAM disk the size of a SS/SD floppy) so that I can compile my Mac/65 source code in RAM, greatly decreasing the amount of time that process takes. But, other than that, I have no use for the many upgrades spoken about. I really don't need a hard drive for my 8-bit; floppies work fine for me. I don't really care much for putting a second POKEY in there, nor for swapping out GTIA for something "better," nor for replacing the CPU with an more modern chip -- all of those things, to me, would make the machine no longer an Atari, but something else.
Yet, there is a yearning among my fellow 8-bit hobbiests for such upgrades. I don't denigrate such longings, they're just not for me. But, I do wonder why.
So, folks, why DO you want 1 MB of RAM in your Atari? Why do you want an 85816 CPU? Why do you want to put a different video chip in there? Perhaps more to the point -- in what way will the usefulness of your computer be increased by doing those things? What are you going to use that 3 MB RAM-Disk for? What about that new CPU? The video chip? The other upgrades?

Again, I do want to have 256K or so of RAM, because I see a need for itt, and by adding that memory I won't lose anything, yet I will gain a lot of utility -- once it is in there, I'll be able to do what I am doing now, only faster. So, I definitely see the need for some upgrades. Others, I don't understand. Please help me see what you all are getting (or hope to get) out of the upgrades you have done (or plan to do).

I'm interested in making my 800XL a terminal, by hooking it up with a serial connection to a PC runnning unix. Has anyone ever tried to do a setup like that? I've heard of it done on c-64's, but I'm wondering if 800XL's can also.

I'm trying to remember! Damn, sounds lilke a problem I saw
when the drive had a bad motor and 'Sucked' down the 12 V power.
The drive still turned only it was drawing too much current. Could also
happen if one of the 12 volt filter Caps. was going bad (open). Too
many possibilities.

Dos 2.5 should not try to read sector 1024 from your disk unless it thinks
that you have an enhanced density (1040 sector) disk. It may have used
a status command ("S") to determine this.

} >standard. For instance, some games come on disks that are readable by a Mac or
}
} ISO9660 is the industry standard, not the PC standard. Rockridge is also
} an extension to the ISO9660 standard (which seems to be designed around
} MS-DOS) which allows longer mixed-cased filenames for *IX type systems.

It is important to know that ISO 9660 file system structure and MS-DOS file system structures are not equal. ISO 9660 is limited in the depth of the directory tree and file names can only be 8+3 and use characters A-Z,_,0-9 whereas DOS allows more other characters in file names.

Rockridge is an extension/revision of the High Sierra format which is more the unix type file names (upper and lower case, not length limited). When you have a rockridge disk, it contains the unixy names along with iso9660 names so it can be read from a pc or a workstation (and a mac???)

Yeah. I think the structure of the XL/XE edition of Mapping the Atari is
actually pretty appropriate: it allows one book to cover pretty much all
the major implementations of the Atari 8-bit hardware and OS.

A hard drive is very nice if you make the 8-bit your primary machine,
otherwise it is somewhat superfluous. In retrospect I would have bought a
floppy board instead so I could use contemporary high density ibm-style
3.5" disks with my atari which would be of much more utility to me at this
point than 150 megs of mass storage... Anybody wanna swap me a floppy
board for a 150 meg SCSI drive? I will say, however, that I'd take the
Black Box over SIO2PC any day, though I'm not sure if it's worth the added
expense--- if anyone wants to make me a decent offer on my Black Box & hard
drive system, I'd be glad to see it in the hands of someone who could make
real use of it.

Joe> Yet, there is a yearning among my fellow 8-bit hobbiests for such

Joe> in what way will the usefulness of your computer be increased by
Joe> doing those things? What are you going to use that 3 MB RAM-Disk
Joe> for? What about that new CPU? The video chip? The other
Joe> upgrades?

I'm not sure why people want a 65816 except that it is a neat hack. For
those who program a lot in assembly, it's probably really cool to have all
those new opcodes. The motivation for the stereo upgrade is similar. Also
some european demos and music software use the stereo upgrade.

The reason for the PAL modification is to be able to run European software
and demos that expect the vertical blank to be at 50hz. It's not really an
"upgrade".

The Super-Video upgrade, on the other hand, simply fixes a lot of ugly
PROBLEMS with the video amplifiers on XL and XE machines. If you use a
monitor with an XL or XE it is a "must-do". You don't know what you're
missing! There's also a little audio fix for XLs and XEs that Ben Poehland
published in Atari Classics that a lot of people have done. You might

prefer to think of these "upgrades" as "fixes" since they don't add any new "features".

And as for talk of 80-column boards, those who use an 8-bit as their primary machine would probably prefer a fast 80-column display on their 8-bit for telecommunications and text editing than to switch to another computer for those tasks.

If you can see the rationale for a 256K - 64K = 192K RAMdisk what is so difficult to understand about someone wanting or needing a bigger one?

Let's see, what other upgrades are there? If you've ever used a floppy drive modified for ultraspeed sector skewing, you don't want to go back to stock, trust me. And the old US doubler was pretty inexpensive. The US+ OS from CSS is supposed to be very nice since it puts RAMdisk support and ultraspeed floppy support in the OS so it's transparent to the user and so that these features can be used with software that doesn't work with SpartaDOS which is the only "stock" DOS that supports ultraspeed (I think there's a patch for MYDOS, but I don't have it). The Mars-8 when it comes will put common, handy stuff like a real-time clock, SpartaDOS X, and the old OSS languages (with some bug fixes, I've heard) all one board, built in. I think the utility or at least added convenience of those is pretty obvious.

I think what you don't understand is that there really are people who still use their 8-bit as their primary machine. I don't anymore, but I love taking a soldering iron to my machines and fiddling around. I would agree with you that I don't see much need for a hard drive or an '816 or an 80-column adapter for someone like me or you, but things like floppy upgrades, video fixes, OS upgrades, smaller RAM upgrades (at the very LEAST for 130XE compatibility so you don't have to have a junky XE around to run "130XE-only" stuff) seem pretty essential to the contemporary 8-bitter...

1427. 600XL trigger weirdness...

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-21 00:00:00 UTC
From: buescher@shed.inel.gov
Message-ID: <BUESCHER.95Jul21175846@shed.inel.gov>
Source record: 89849

Thanks Ben for the instructions on upgrading my 600XL. It works great! With the monitor jack restored (Super Video) it makes a really neat little system!

There is one strange thing. Out of everything I tested with it, one game--- Final Fight on cartridge (one of the XEGS releases, I think)--- flakes out. It registers a lot of false triggerings of the joystick trigger. I couldn't test it on another 600XL since it requires more than 16K of memory, but I tested it on an 800XL and an 800 and it works fine. I swapped out every single chip on the 600XL motherboard to no avail. Final Fight is the ONLY program I've found that does this--- EVERYTHING else seems fine. The memory tests out fine with the self test routine in ROM. Does anybody have any clue what the problem could be? Is there some flakiness in the 600XL's joystick inputs?

This is hardly critical. I don't really like Final Fight, I just happen to have picked it up at a thrift store and had it on hand to test the machine with.

Source record: 89756

Joe, in the modified system vein & why. I have a tendancy to keep all my source code on a single disk. This is mostly because I use Action! as my language of choice. As a matter of style, I prefer to have things like alternate character sets included in the progam as byte arrays rather then loaded from disk. Takes more then a few bytes to do it this way, ditto for things like graphic 15 screens, they bloat to 30k. Couple of character sets, a MicroIllustrator byte array or two, Action! run time package & a dozen versions of my program, next thing you know I'd be getting a little short of disk space & a 64k ram disk with DUP.SYS on it wouldn't cut it for compiling from ramdisk. I have a MAC65 cart, but I don't use it that much. When I first got MAC65 I thought I was going to define a ton of macros, but never got around to it. I imagine if I did define a bunch of macros it wouldn't be as bloated as Action source, but then as far as I can tell nobody really uses the macro cabability of MAC65 to it's fullest. If I spent more time in MAC then Action I probably wouldn't need the extra features, but I don't think I'll go back for anything but writing small code blocks for use in Action or Basic. Since I don't use MAC that much, I absoultely need a monitor/debug type program ergo Omnimon.
I wish I could remember the name of the guy who wrote Caverns of Kafka, Brian Bonito maybe? Anyway I read he developed it on something like an Atari 400 with a cassette! There's a strong correlation between big systems and things like great bbs's, power applications, etcetera, but I don't think there is one between a pumped system & a great user/programmer.
I think I have my Atari collection under control now, something like 5 800XLs, only two are stock, a 130XE, an 800, 4 1050's one US Doubled, old two board 810 serial number around 1000, ATR8000 with [1-5.25" 360k, 1-3.5" 720k, 5.25" Teac switchable between 720 & 360k, one Mitsubishi 5.25" 720k] & my pet favorite, 1200xl with two OS & 256k. But I'd readily admit, except for maybe the 1200xl, a US Doubler, & my SIO2PC cable, everything is surplus over what I really need. Surplus or not, I'm not giving this stuff away just yet, but if anything it takes creative time away from me since I and anyone else with this much junk spends more time maintaining it then using it!

JH; Just an opinion, but I think what is really needed is a streamlined language for the big two platforms. I'm guilty of this myself, wrote a basic in C, but what seems to be happening is compiler writers are writing compilers in C for programers writing applications in C. This redundancy of bloating is sick. I always love it when mags like DDJ compile the "Hello World" message or some other trivial program & report the size of the finished code. I think the bigest I saw was something like 30k for a Prolog but don't quote me on that.

>computer be increased by doing those things? What are you going to use
>that 3 MB RAM-Disk for? What about that new CPU? The video chip? The
>other upgrades?

I think there are at least two major categories of users here. Some users still do productivity work on their Atari's, and thus increased capabilities will result in increased productivity. The second group of of users just enjoys playing with the machine and doing things mostly for the enjoyment of doing them -- as opposed to really needing the results of the operation. I basically straddle both of these definitions. That being said, I think most of the proposed upgrades are useful, and don't remove anything from the design I love so much. I wouldn't draw the line until something _replaced_ an existing element of the machine, instead of _adding_ to it. For example, adding a new video chip that gives additional modes I would consider a good thing, whereas I would have no interest in pulling the ANTIC chip out of the machine and replacing it with something else -- no matter how neat it was. Along these lines, I wouldn't have any interest in this newly proposed OS that isn't compatible with existing programs. (For the record, I will be willing to port, or help port MAE to a new environment, because I feel it would be important).

Anyway, to specifically address the various upgrade ideas:

New CPU-
Most of my 8-bit time is spent programming, and the 816 is an extremely cool chip. It increases both productivity and enjoyment of programming for me, and even opens up some new tricks for the Atari hardware. (Things like pointing the Direct page into the hardware registers. GED will get 25% or so more colors as a result.) It can also double the speed of existing applications, and it's hard to see this as anything but a benefit. I'd never want to replace the CPU with a 68000 or anything else, but the 65816 is fully upward compatible, with the exception of code which used undocumented opcode quirks of the 6502.

Video Chip-
40 column video is really limiting for a lot of applications. Anything that provides a nice 80 column screen, with hooks into E: so that existing software can use it, (some software will need upgrades), helps out those applications. It would be great for dual-screen debugging also. (Run the debugger on the video chip, while watching your program on the ANTIC screen. I used to use the Austin-80 card for this). For the users that don't have other machines, I'm sure many would welcome a

256+ color mode in decent resolution for viewing graphics.

RAM-
Well, it seems like I've never really needed this. I could put multi-megabytes of liner RAM on my 816 machine, but I have only 32K of upper memory currently. I also have only 128K of base memory, like a stock 130XE, and don't think that I have ever run out.

Hard Drive-
I consider the reliability, convenience, and safety of the data significantly more important than the increased speed, but even on the speed issue, well... you can pry my HD from my cold, dead fingers.

Michael, in case you didn't know (but I'm sure you did.. maybe I just like pointing this out to everyone, JUST IN CASE someone missed it the other 100s of times myself and others blathered on about this)...

The Sweet16 has 16-bit registers (X,Y,A) as well as a "B" register (not supported as an addressing mode, you must use a "transfer-A-B" instruction.. but still.. an extra register! :))

Page 0 can be relocated :)

Page 1 (stack) can be relocated :)

Page 1 (stack) can be 64K ($10000) long, not just 1 page! ($100) :) :) :)

Cool, huh? :)

I told a Polish guy I was talking to (from the "Tight" group) about the S16 and he WANTS ONE (kept changing the topic of #atari8 in IRC to "I want S16!" :))

>got to see were subject lines...

The VCS emulator is out there. It's made by Activision and is called Atari
2600 Action Pack. My understanding is that although it comes with 15
Activision games, any 2600 cart will work if you can transfer the code from
the cart to a file. It doe not work well with Windows 95 ot NT, just 3.1.
I bought it and when I opened the package, it said it was only for Win3.1, and
not supported for Win95 or NT. I tried it with Win95 and they were right. It
runs once, and then you can't access the game again. If you have Win3.1, Sam's
has it on CD for $14.00.

>Atari 400 with a cassette!

I first started assembly with a 400, 410, and asm/ed. Nothing more fun
than assembling to casette! As a matter of fact, most of the programs I wrote
using the 410. When I got a 1050, I spent more time playing all the games I
couldn't use before.

The ClarkNet Archive has about five years' worth of Antic and Analog
monthly disks. FTP to ftp.clark.net and go to the /pub/atari/antic and
/pub/atari/analog directories.

I don't know about a STart archive...

|> only the remaining 8 colors blue. I know that will reduce the
|> amount of colors to a lousy 2304, but that's enough. In fact,
|> the documentation to a JPEG viewer I have says that the human
|> eye can distinguish less differences in blue than any other
|> wavelength, so this works out rather nicely.

The 4096 colors is 16 x 16 x 16. Replacing the blue screen with a GR.8
would reduce that to 16 x 16 x 2 or 512. The border would still be a sick
red/green mix. The underlying problem with GR.9 is that no color (save
white) goes entirely to black when the luminance is 0. With hardware
mods this might be possible...

What you read in the JPEG docs is correct to some degree. When I've tried
reducing the number of bits representing blue elsewhere, it has not always
performed as good as I had hoped.

Burnt Toast Man,

Your original post said Gr.8, instead of Gr.10, and that confusion may have added to the cause for the limited response.

Otherwise, my guess would be that the loss of blue shading ability would be noticable, and that the red and green screens would still tint the areas that are supposed to be black. It would just be brownish instead of blueish. (Would be darker and closer to black though). I think the only significant benefits might be to pics with large dark areas, or as an overall increase in contrast. I'd still like to see it done though, and just maybe the results would be really nice.

As you say, it should cost very few bytes to have this mode as a selectable option.

I have a working Atari 800 computer which I would like to sell. It
includes the
built in video cable, power supply, two joystiks and the progam recorder
(untested program recorder).

The following cartridges are included:
Missile Command CXL4012
Defender CXL4025
Qix CXL4027
Basic Computing Language CXL4002
Star Raiders CXL4011
Q*bert Parker Brothers
Atari Lab Starter Set with Light Module cartridge AED80014, box and some parts

Also included are some untested tapes: 1Blank Tape, Scram CX4123, and
Federation from AIM software.

Price: $30 + shipping

Brent- I agree with a high level language to support this.. but one problem is not everyone likes to stick to high level languages - or any particular high level language...

But, an Action!-ish language and a simple assembler (or a version of MAE_95?!) would be very very nice - of course with all of the support built in....

ahh... but doing it that way would be the downfall of the thing UNLESS EVERYONE who wrote a program for it supplied the source code... what if we wanted to upgrade or change the way things work??? Recompiling would have to take place once the compilers and assemblers have been updated. <sigh!> And what if you accidentally ran a program compiled under WHATEVER v.0.1 but your system is currently executing managers and other software running WHATEVER v.0.2 !?!? Opps!! :(

Sooooo... we SHOULD do it like Diamond GOS did it.. but of course, cart. is out of the question, otherwise the userbase would be TINY! :) (D'oh!) And... if we were to make a good, powerful OS, we'd need to use banked or large linear (65816) RAM to do it... 64K is cramped - esp. with task swapping (and lets try not to do it the dangerous way like we do now, with SnapShot (although SnapShot IS cool! :)))

Soooo... it should be a Sweet16 program, unless people can really stand 6502 with banked. (I don't really think I can.. but of course, I'm getting a Sweet16 :) :))

Anyway.. I'm babbling now..sorry.. kinda tired.

> You see, my system is very much "bare bones" in comparison to those.
>None of my hardware is modified. For the most part, I like it that way.

Same here. I did the mere trifle of an audio upgrade (one capacitor) because I hadn't done any wire-clippers and soldering iron kinda stuff in a while and thought it would be fun. The 65816 holds some interest because I programmed it at my day job for a while. Otherwise, I don't have a need.

There's also the peculiar way that needs expand as computer capabilities do. I never had any problems with memory on my 800, though sometimes I wish I had a modest RAMdisk so assemblies would be faster. 48K used to feel limitless and it still does. Now I'm trying to squish a Macintosh program to make it run in 8 megabytes. People just casually throw about phrases like "800 meg hard drive" and "16 megs of RAM"--which is ridiculous IMO--and yet these vast spaces feel tighter than 48K. The huge specs don't seem to satisfy anyone; they're never enough. I just saw a columnist ragging on the just-out-the-door Power Macintosh 9500 for being too slow (i.e. only 15% faster than a same clock speed unreleased P6). Good grief.

1450. Task Swapping for this OS discussion

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-23 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <199507232140.OAA17570@zippy.sonoma.edu>
Source record: 89656

For folks interested in task swapping, here is some stuff I came up with
a few months ago for the ADOS project. The URL to this document is:

http://zippy.sonoma.edu/~kendrick/nbs/tasklaws.html

accessible from the (small) ADOS page:

http://zippy.sonoma.edu/~kendrick/nbs/ados.html

Here is the document (tasklaws.html) as shown my Lynx web browser:

-bill!
kendrick@vax.sonoma.edu ||| kendrick@zippy.sonoma.edu
William (Bill) Kendrick / | \ ** New Breed Software **
http://zippy.sonoma.edu/~kendrick

--snip--
TASK SWAPPING LAWS

These are the "laws" as I describe them to which a task-swapping
GUI-style environment should obey.

These laws are based on the Macintosh System 7 environment and will
hopefully be used in ADOS or K-OS for the Atari 8-bit platform (or
Atari Sweet-16-based machines).

Terms:

The terms and acronyms used in the law descriptions are as follows:

* CLI: Command Line Interface
An environment where the user tells the interface to execute
programs by giving it their name (and location) and the parameter
list to send to the program.
Examples:
+ MS-DOS
+ Unix
+ SpartaDOS
* GUI: Graphical User Interface
An environment using bitmap- or text-based graphics, usually
using:
+ Windows
+ Icons
+ A pointer (usually mouse-driven)
+ Menu-bars

* OS: Operating System
A set of routines which are installed in hardware (ROM) or loaded
at boot-up (stored on disk and transferred to RAM).
* F-Man: File manager
A program which presents the user with some sort of access to
his/her files and applications. In a GUI, this would of course be
a windowed system.
Examples:
+ MS Windows 3.1 Program Manager
+ MS Windows 3.1 File Manager
+ Macintosh Finder
* E-Man: Environment manager (or "shell")
A program or OS routine(s) which bridges the space between the
user interface (CLI, GUI, etc.) and the programs.
The E-Man would place commands and parameters in a list and then
jump to or execute a program. The program would then act
accordingly.
Examples:
+ MS Windows 3.1 File Manager: File types (depending on thier
extender (.TXT, .GIF, .WAV, etc.)) would be associated to
certain programs (Text Editor, Graphic Viewer, Sound Player,
etc.). When the user tells File Manager to open a file, it
would launch the application and tell it to open that
specified file.
+ Finder: (Acts the same as Windows 3.1 File Manager except it
determines type and associated program as "resource" data and
is almost never determined by the user.)
+ Unix: Unix converts (variables, wild-carded file lists, etc.)
the command and parameters and executes it.

Opening an Application

In a GUI F-man or P-man, this would be double-clicking the
application.

This can also be performed from within other non-F-man applications. A
C-compiler might have other "external" programs it uses such as
editors, linkers, etc.

IF THE APPLICATION IS ALREADY "RUNNING"

Simply jump into it

IF THE APPLICATION ISN'T "RUNNING"
1. Load it into memory
2. Jump into it
3. Tell it to do its installation routine
4. And tell it to do its default load-up action (ask the user to open
an existing file; create a new file; do nothing; etc.)

Opening a File(s)

In a GUI F-man, this would be either double-clicking the file(s) or "dropping" the files into the application.

Non F-man and P-man programs can also perform the task of loading other applications.

For example, a World Wide Web browser can jump into a text processor to view HTML source files or into an MPEG player to play MPEG animations.

IF THE FILE'S APPLICATION IS UNKNOWN (N/A IF "DROP" IS PERFORMED)

Report an error or prompt the user for an application to process the file with

IF THE FILE'S APPLICATION IS LOADED OR NOT LOADED
1. Load or jump to the application
2. Tell the application to open the file(s)

Special Case: Direct Returning from an Application

A good F-man should be able to process multiple files at once. For example, the user can select a half dozen text files, double click the whole lot, and the associated application (hopefully a text editor) would load up all of the files.

Another example is say 3 text files and 3 graphics files are selected and then "opened" (double clicked). The F-man would load the text editor, tell it to load the text files and also tell it to return to the F-man (or E-man, assuming the F-man would be piping a batch of commands to the E-man; E-man is useful for smaller machines because the F-man would be a large, complex program, and the E-man would simply be the actual program launching routines, without the user interface). Once the F-man has been reloaded or jumped back into, it would then load the graphic viewer, tell it to load the graphics files, and either stay in the graphic viewer, or return to the F-man or E-man and it would choose which application to load.

EXIT (OR RETURN)

Along with other basic commands such as launch, do nothing, and open files, this would be another option which would return to the previous system level (E-man or F-man (see above)).

Special Case: Auto-quitting an Application

A good F-man should also support a "shut down" feature for quickly exiting from all applications (properly) and quitting the F-man (either back to the lower level environment (DOS for example) or allowing for powering down).

It's also useful for the F-man to be able to see what programs are idle (without open windows or files) and let you quit them when you try to open a new application but are lacking the memory to do so.

QUIT

The program will simply act as if you selected it's own "Quit"
command; prompting you to save open files (if any), if you're sure you
want to quit, and closing up support files (preferences, data files,
etc.).

1451. Task swapping note...

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-23 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3uugs0$app@nic-nac.CSU.net>
Source record: 89657

BTW, I did do some simple task swapping stuff in TurboBASIC XL to simulate and test some of how task swapping could be acomplished using a RAMdisk..

I think with 65816's "big ram" capabilities, use of a RAMdisk (or HD) would only be needed for "virtual memory" - ie, when people want to run more stuff than they can fit in their Sweet16'd XL, or if their Sweet16'd XL doesn't have a Sweet16-compatible RAM upgrade.

I believe one example was done mainly with a CLI-type interface, and the other with a very braindead pull-down-menu interface (which was more limited than the first test when it came to what it could do!.. the first test included an editor! :) you could 'shell' out of it and it'd auto-matically save your text file and then reload it when you returned to the editor (which in itself needed to be reloaded from a "VRAM" directory on the RAMdisk ;))

1452. Help: Need name of old Atari game

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-23 00:00:00 UTC
From: J LeBeau <jlebeau@dnai.com>
Message-ID: <3ute6r$hp5@hilbert.dnai.com>
Source record: 89658

Help. Need name of old Atari game circa 1984-85. It ran on my old Atari 800. I think it may have been from Broderbund, but I'm not sure.

Here's what I remember:

1) It had excellent (for the time) graphics and animation.
2) It was a climbing type of game with 4 or 5 "levels" per screen.
3) It had animated cartoons between screens.
4) Your character was a little bug-eyed creature that would walk left or right and climb up and down ladders (or elevators?).
5) The "bad guys" would throw these slow moving swords, knives, and spinning weapons at you; your job was to duck under or jump over these while climbing up to higher levels.

Vague, I know? But that's all I can remember. Any thoughts? Like I said, very nice graphics, slow moving action, very hard to get past more than three or four screens.

Please help with any thoughts.

This is silly. Not much of an operating system is needed for the 8-bit machines, certainly not something in the UNIX or OS/2 sense. Much too complex and unnecessary, IMO. And both Action! and 6502 assembly are simple and clean languages; once again, C is too complex of a solution.

I think the reason there isn't much good software being released for the 8-bit machines is simply because no one is writing any.

Okay, I understand that now. :) But, what utility will a person
get out of such a new OS? Is there going to be enough software avaiable
to justify purchasing (assuming it is not freeware) and learning a new
OS?

Joe-

If I had the ability to make a new OS as described by what the ADOS team feels would be a good OS or utility/resource package (ie, routines that ADOS-specific programs would use- a la MS Windows 3.1) >I< would make it free!

Also, the learning would not be how to use the OS, unless you were to program apps. for it (and btw, I feel apps. should be easily programmed in a high level language- esp. since that's easier to understand, upgrade and alter) (also, I think the OS might due well to be made in a high-level language, but one with low overhead.. Action! or some new, not-yet-existant language).

AND - the interface the OS presents (and the programs use) should NOT ONLY be SIMPLE to use (point/click, menu-bars, etc.) BUT be USER-REDEFINABLE!!!

ie, I might want my menu bars to appear at the top of the screen- every time I change programs, the bar changes with it... OR, I might want the menu bars within the windows...

if one did not have this support in the beginning with the OS, they should AT LEAST leave the possibility open. ie, if I wanted to specify my program's (or even part of the program's) menu-bar, I'd do it in a way where >I< did not care what the "OS" did... as long as it did SOMETHING which presented a menu to the user.

I looked at some Action! reference file I got from, I think, UMich.
It had a few mistakes, but on the whole was a nice doc. I don't know
who made the original, but I edited it up, mentioned FTE's current
ownership of Action!, and put a new copy onto Umich. (actref.doc)
(blurb is: actref.txt)

It sounds a lot like DROLL, although I don't remember for sure, I think it may
have been Broderbund. I remember the game well. I'd like to get a copy.
The knives, axes , etc. were slow but there sure were a lot of them! Really
good music and opening screen.

Hmm - why not some Gr.10 mixed modes? (not just CV-9-9-10 like proposed,
but how about CV-10-10-10... 9 colors per screen, 1 in each could be
raw black, the rest 8 would be shades of RGB.. perhaps the ability to
change it from RGBRGBRGB down the screen to RGBRGB ACROSS the screen would
REALLY reduce the flicker)

Hmm.. perhaps I'll play with this idea ???? :)

Actually I have done it. I did it with a standard NULL modem cable, and an
850 interface, and Bobterm. I configured a tty in gettytab under BSD, and
on my serial.rc (I believe that is it) I did something with stty. I think
it was stty /dev/ttyd0 -clocal, which told BSD that a return would activate
the terminal (basically a carrier is not needed). I don't know what you
want to do, like an SIO device or what, but this is the way I did it.

I think you have a valid sentiment, there -- nobody wants to change the essence of the Atari 8-bit. In fact, I am merely looking to enhance it. It is for this reason that I would use the Atari's built-in ROM to accomplish device-independeent I/O, etc. The new OS would be completely disk-based (no hardware modifications whatsoever), so running your old software is a simple matter of NOT loading the OS.

Once again, the advantage of a new operating environment is that you can accomplish today's new, complex computing tasks on the original Atari. A fascinating notion indeed!

1463. JView/CSView: Lose the blues idea!

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-23 00:00:00 UTC
From: toastman@armory.com
Message-ID: <3usgga$5cl@news.scruz.net>
Source record: 89775

I received no response to my last message, so here is a much more articulate repost.

Currently, Colorview currently displays a 4096-color pic by cycling through three Gr9 screens: one red gr9, one green gr9, and one big old blurry blue gr9. Complaints have been raised that the blue layer generates blue haze even when it is completely dark. The result of this is that dark pictures, especially space scenes, look a lot bluer than they're supposed to look.

I'm thinking that this problem could easily be eliminated by changing the blue layer into a Gr10 screen, in which all of the color registers may be manipulated. We would only have eiught blue scales to work with, but that still gives us 2048 colors. If one is really concerned over the compromise, one can put an option to turn off blue Gr10.

I've looked at a reference manual, and found that it is possible, and in fact I remember APACVIEW switching between Gr9 and Gr11 in a feeble attempt to produce 256 colors.

In Gr10 mode, the background register becomes colors 8-11, and colors 0-7 are readily available. Put a black in register 0, put blues in registers 1-7, and leave the background the way it is... and for optimization, put a $7F in the PRIOR register, so that we can get into the blue palette with a simple INC $D01B, and out with a DEC.

Converting existing works is easy A simple post-processing process after decompression will make the blue layer Gr10 compatible. Before putting the picture on the screen, all one has to do is take all the bytes in the blue layer and give them an AND #$77 and a ROR. That's child's play, just waiting to be put into the next version of Jview or CSView.

It is my belief that all this can be implemented into CSView OR Jview without adding more than 1K of code to either program. Actually, I'd be surprised if it took more than 256 bytes. 128, even.

Well, I'm awaiting the "COOL! I'll get right on it!"s by the programmers out there. Thank you for your attention.

You will not find "standard" ID numbers or specs for custom chips from
Atari. They were designed by Atari and built only for Atari.....ok not
the 6502 but the 6502 "Sally" was modified per Atari specs. Not to be
confused with the 6502C, not an Atari item.

I have a few "select" peripherals around here I'd like to sell if anyone is interested. These items are all in "Like New" condition, with all docs & accessories:

1.) Hayes 1200-baud modem, $15.
Not state-of-the-art any more but works fine, not in original packaging but with docs/transformer/phone cable (no serial cable). Uses standard Hayes commands but they must be in upper case.

2.) Supra 2400-baud modem, $30.
As new in original box, little used, with all original accessories except the serial cable. Uses standard Hayes commands, not case-sensitive.

3.) Frontier Software Printer-Q, $30.
VERY rare item in the USA! This is a 128K parallel print buffer with many neat features. Upgradable to 1-meg total RAM in 128K increments using 1-meg DRAM chips. It uses the exact same case hardware as the Supra 2400 modem above, classy brushed aluminum look. Frontier is a British company, this was a test unit I evaluated for them but they decided not to market it in the USA. With docs, Centronics cable & power supply. This is a useful item for people who get timeout errors printing long documents from the printer port on the XEP-80, that's what I used it for.

4.) U/S Doubler 1050 floppy drive, $45.
In original Atari carton with ICD docs, SIO cable, power transformer. Also includes the original Atari chips that were removed when the Doubler was installed (these are needed to troubleshoot/test the drive if it ever fails, the Atari test software doesn't work on modified drives).

Prices on all items above include postage in the USA.

Early bird gets the worm!

1400xl's.

Humm....a little rough on the guy!

Their were a couple of versions of the 1400/1450 main PCB done. The most common is a 4 layer version (power and ground in the middle) that supported both the 1450 and 1400. The 1450 controller board plugged in via a ribbon cable to the main PCB. There a quite a few 1400/1450's floating around......I have one also (1400).

Additional ROM was needed to support the drive controller and built in speech. The console was going to be expensive to produce and really provided nothing new performance wise.

The 1090 expansion box did not support IBM cards and was very unreliable due to timing problems with the XL PBI. The only working cards produced were a ram expansion and I believe a version of the "1099?" CPM emulator.

Right-o. RAMdisks are nice, if you're into compiling large programs.
And, for someone who has programed a 65816 in a prior job or something, having
a machine with that processor might be nice. But for the average Atari
user? I dunno. I really don't. Personally, I see no need for it in what
I do. But maybe I am missing something entirely. Hopefully, someone will
respond and let me know. :)

That's a statement with enough to talk about that it merits its own
thread! :)
Computer use is a hobby...and those who use "orphaned" computer
systems are (on average) far more likely to spend all their free time at
their hobby than others. It's a bummer when things don't work as planned,
but it is also fun to go through the process of taking care of the darling
little things. :) yesterday I spent a few hours trying to get my Okimate 10
to print like I know it can. In one sense, it was a poor way to spend time -
far better to actually have it printing useful things than fiddling with
settings and such. yet, in onother sense, it was fun and satisfying to do
that work.
Like I said, it merits its own thread.... :)

Oh, definitely! :) Even the Borland C++ compiler I use is guilty
of code bloat, and I believe (tho am willin to be corrected) that it is
a fairly good compiler. I've written tiny programs on it that compiled
to a size that wouldn't even FIT in an Atari -- yet I could do the ame
thing in Atari BASIC and have tons and tons of RAM left over.

er, same, above, not "ame"

Sounds like a fair estimation. I fall into the second category,
as I don't get paid for anything I do on the Atari. Even if I write a
really cool program, it wouldn't be to get paid. I'd be doing it because
I love the platform (thus I am not doing it on my IBM clone), and because
I love programming.
yet, I see the need for more RAM, so perhaps those of us who don't
use Atari's to earn money still have valid reasons for upgrades...

>New CPU-
>Most of my 8-bit time is spent programming, and the 816 is an extremely

So I could plug in the 65816 upgrade from FTE, and just run it in
6502 mode (or whatever it is called), and end up running all my old
applicatins twice as quickly? I didn't know that -- I thought it wouldn't
handle that stuff as well as that. What about old games and such that are
dependent on the speed of the processor?

>Video Chip-
>40 column video is really limiting for a lot of applications. Anything
>that provides a nice 80 column screen, with hooks into E: so that

>256+ color mode in decent resolution for viewing graphics.

I can see the use of a new video chip for programming and other
such things. But, I seriously doubt whether it is a worthwhile thing for

a programmer to support == the market would be tiny. It would be as if
I wrote a progam in Atari LOGO, then distributed the source code -- few would
ever see my work, because too few people have Logo.
So, the video upgrade is good for those who would use it for their
own, single-user purposes, but I don't think those who buy them will find
much software not of their own making to run on it... (Talking about the
graphics portion, of course, not the E: uses).

>RAM-
>Well, it seems like I've never really needed this. I could put multi-
>megabytes of liner RAM on my 816 machine, but I have only 32K of upper
>memory currently. I also have only 128K of base memory, like a stock
>130XE, and don't think that I have ever run out.

That's interesting! Was this the case prior to your owning a HDD?
I can see how hooking a HD up to the Atari could make the utility of extra
RAM rather low (RAMDISKS are faster than HDD, sure, but not THAt much faster
to justify the expense). But what about before you had the HD? Didn'T it
bug the heck out of you to have to compile from disk and to disk all the
time?
Then again, I am spoiled by working on the decadent platforms with
tons of ram and fast hard drives. I bet if I had only used the floppies
for compiling, I'd be much more tolerant of the speed...

>Hard Drive-
>I consider the reliability, convenience, and safety of the data
>significantly more important than the increased speed, but even on the
>speed issue, well... you can pry my HD from my cold, dead fingers.

heh. Well, yes. :) I would probably have one if it wouldn't mean
redesigning my computer desk, which really can't support a black box and all
the attachments and such. Space is cramped as it is! :)

That makes perfect sense to me -- as a fellow SysOp, I couldn't
imagine running a BBS from floppy. :)

>I not only wanted extra speed from the ramdisk (most programs loaded FROM
>RAM), but wanted a ton of storage for "ARCHIVING" all of my beloved 8bit
>software. <oops, hope M. Current doesnt send the software police after me
>for archiving my own disks onto hard disk>

So your BBS has its programs and support and whatnot in RAM, which
makes you need 512K in your machine? Do I understand that right? Or is
there some other reason for your relatively large RAM?
Also, on another topic, what happened to Xmission? Did I miss a post?
I ftp'd there yesterday, and found all the directories gone -- everything
is archived by year now. Why?

The 65816 should be capable of at least a task-switching environment. A Apple][GS-ish system, essentially a MAC Junior, is possible on such a system. To limit a 65816 Atari to the current OS is to hold it back, IMHO.

One of the reasons there is ANY remaining userbase for the CoCo3, for instance, is that OS9 (which was NOT the original OS for the CoCo) became popular and although the machine is slow by today's standards, it is an elegant OS and can do a whole lot more than a nonmultitasking OS.

Even users of 7mhz Amiga 500s with 512K can do more with their machines than an 8mhz 286 user can do by virtue of the better operating system.

If the Atari is going to survive, I think it needs something new and exciting. If it means losing some backwards compatibility, so be it.

The mortal James King wrote:
: My only concern is that no current software would work with it.

If an ANSI C system were developed in conjunction with the new OS then you could port a lot of mainstream apps over (albeit fighting against the limitations of Atari GFX). There is probably more of a chance that there could be new and GOOD software for the Atari with a new OS and C compiler than just using the old or patched OS with the 65816 and having to write stuff from scratch.

I think one kluge with the gfx is to implement a scrollable display. If a C program wants a 640x400 display then make it a 320x200 window which is scrollable. In a 65816 system, ANTIC could have a free run of main RAM and you could open very large scrollable screens. This is how the Amiga works when you try to open a screen larger than your display resolutions. It should be built into the OS so you don't have to custom code the scroll routines with each app.

Other gfx tricks like GED or ColrView might also be possible as a builtin OS routine to be used as a pseudo graphics mode. ColrView could become a standard mode like a HAMjr. Maybe on a 65816 you could actually have some cycles leftover after opening a ColrView display to be useful for more than just static screens.

: fascinating notion indeed!

Yes, you can do a lot even with a 1.79mhz clock as long as you have a
good CPU (which the 65816 is) and a good OS.

A good OS should have the following:

At least a cooperative multitasker, preferably preemptive with priorities
Interprocess communications language
The ability to support ANSI C
New graphics API to support things like autoscrolling larger images,
perhaps even making GED and CV into automatic modes.
At least some basic GUI functions.
A filesystem that supports larger partitions and a break away from 8.3
filenames, maybe also a cache in "fast" ram.

Primenet is a unix shell account system, however, for dodos it has a vt100 menu layer you can use to navigate through the net.

The biggest problem for any bargain-basement guy wanting to get online with the Atari8 is the lack of an affordable high speed serial interface (Curces Bob Puff!!!). With 14.4s around $99 or even less, this is a big problem. Once users realize they have to suffer the slings and arrows of 9600 sans hardware flow control or pay big bux for a Black Box they usually ditch the Atari8 :(

Well, I've never tried to code CV modes, but I've started (barely) in
Action! I kind of wonder if my skills with the ol' ANTIC chip aren't
good enough, though, and if any one out here (Jeff Potter, Clay Halliwell?)
would try making a simple CV9 viewer (plain .R,.G,.B) which uses a CV10
mode (8 shades of R,G,B plus 1 pure black = 513 colors (not a typo)).

I'd like to see if this mode is actually even worth pondering over. :)

Thanx!!!

Joe - no, plugging in a Sweet16 won't make your current 6502 software run any faster.

The thing with the Sweet16 is, since it's a 65816 CPU on board, it can emulate 6502 mode (which gives you EVERYTHING except 16-bit registers, I believe), AND it can run in "native" mode (which, again, gives you EVERYTHING, including the ability to run 6502 code (which is simply part of the 65816 instruction set), INCLUDING 16-bit registers, BUT you lose something like how interrupts are handled, or something...)

Joe, my C for my clone is Turbo C 1.5, I've never upgraded because I always figured it would just get me a more bloated version of a compiler that I already considered bloated<g>. I've got a couple of other Cs including MS Optimizing compiler, but the only advantage of that is it came with MASM. I may fool around with programming on the clones again, but IMO most of the compiler writers are really missing the boat. It's probably just me, but Action! is about all I want in a compiler, even if it was implemented on a MS DOS platform. But then I don't remember the last time I needed floating point arithmitic & haven't used stuctures in about 6 years! It's really time for me to program something other then a utility. I'm fooling with the idea of a 3d rogue clone for the 8 bit. The few people that have seen the rigged demo like it well enough. Got a ton of hardware stuff to finish, but I think I'm going to do the rogue thing. I can't draw worth a damm, sound effects & muzak reveal my acute version of tone deafness, but I do know the Atari's advantages due to hardware & I think I just thought of a couple of tricks that would make it seem like a bigger game. Got busy with a Jr High program teaching kids computers, but I should finish something in the gen're.

Source record: 89794

Thanks to all the users who gave me feedback on new 8-bit OS I proposed a few days back.

Alas, I have yet another question for you:

How many of those interested in the new OS have computers with at least 128K? If you have such a machine, what type is it (i.e. a 130XE, 256K XL, Axlon 800, etc.)?

The information is important because it's looking like the OS would run much better on a high RAM machine. This is due primarily to the fact that a 64K computer would need to page the OS and any resident applications to and from disk in 8K chunks. Obviously, this would be painfully slow.

However, a 128K machine would be able to keep the entire OS and a few applications in memory before it needed to page out. Furthermore, when the memory DID fill up, the paging could be done in 16K blocks -- a much more efficient number.

Thanks for any feedback you can offer...

Michael Ellis

c >Date: 4 Jul 1995 02:52:20 -0400

c >Does anyone know why the /X parameter doesn't work when you are trying to
c >Copy file(s)? Is this also a bug in 4.50?

Yep, I guess it doesn't work in any of the versions of MyDOS that Bob Puff
worked on. Charles Marslett said the following in a letter he wrote to me,
dated January 20, 1989:

"There are three relatively obvious problems with this version of MYDOS:
the "/X" modifier does not work properly in the "C" command, the "J" command
does not properly format the destination diskette (omitting "/X" is the same
as including it), and hardware errors (bad sectors, etc.) are reported with
the wrong error code fairly often. These seem to have arisen when we
converted the code from the AMAC assembler to the MAC/65 assembler.

Version 4.50 was written by Bob Puff and Charles Marslett, all later versions
(4.51, 4.52 and 4.53) were written by somebody else. Can't remember his name.
(Would be nice if PabQWK let me browse through some textfiles to look some
things up.)

Hope this helps.

Maybe Bob Puff will finish version 4.60.
BTW years ago, ANALOG Computing mention somebody had written a version 5
(can't remember the name or the issue, but it was ANALOG for sure and I believe
the first name of the guy was Frank.

l >From: luca@embratel.net.br
l >Subject: FAQ
l >Date: 5 Jul 1995 05:09:20 GMT
l >
l >Could someone please post the ATARI FAQ or e-mail me it?

It's posted every month or so, in two parts, one is posted around the 15th,
the other one around the 1st. And then there are some un-official FAQ's.
They are posted at random I guess.

l >Also some questions :)
l >
l >1 - What archiver does Atari use?

We use the ARC format. SuperARC & SuperUnARc are the best.

l >2 - Is there any QWK offline reader for Atari?

Yes, PabQWK, it'S not always easy to use, but it's the best we have.
You need atleast 128kByte to use PabQWK.

l >3 - Whats a good agenda program?

Buy a paper agenda. You can take them along. And it's faster. A paper
agenda, you only have to grab and open, then check the things you want to
check. With an agenda program you have to;

Plug in the power,
Boot the computer,
(auto-) load the program,
if the program doesn't use some kind of hardware clock, or if you don't have
any, you even have to enter the date.

Takes way to long.
Even a 486 at 100 Mhz wouldn't be faster then plain old paper.
And a lot heavier too...

s >
s >So...please: which MyDOS version should I use w/large drives?
s >
s >Thanks!

Nope, their is no 4.54. There are two versions of 4.53, one uses 3 digit
sector numbers where possible, known as 4.53/3, the other (which I still
haven't seen yet) uses 4 digits minimum.

4.53/3 would be the best.

c >
c >I think I read that 4.53/4 was a hack from in here, possible by the person
c >who posted it.

Well, somebody (David something Eisman maybe??) did all versions after 4.50,
but 4.53/x uses the same structure as 4.50. So 16meg is the maximum.
Remember, when Charless Marslett was here a couple a month ago (wish he'd
come back), he said something like, in SD and Medium D MyDOS could/would
use filenumbers in the sector links. In all other cases it doesn't. Leaving
16 bits for the "Next sector" number, or 65536 sectors.

Just a thought on this CD-ROM thread, since the MIO II will use an IDE drive (
and yes it does exsist, I have seen it,) couldn't you just use and IDE CD-ROM
on it? For that matter, why not use Bob's IDE hack for the 1200 to do the same
thing?

If I decide to go ahead with full-scale development, the new OS would use a preemptive multitasking scheme.

> Interprocess communications language

Interprocess communication will be supported.

> The ability to support ANSI C

ANSI C support is not IMPOSSIBLE, but in today's world machines running at 1.76MHz and doing all of their work on three 8-bit registers really need machine-language-based software. Indeed, all of the code I write will be machine language -- be it an OS or an application.

This is an interesting problem. There are enough 3rd party products out there that require a custom File Management System. Right now I am leaning toward leaving the DOS routines as they were and augmenting them by adding resource-sharing mechanisms. This would allow hard disk users and large RAM disk users to continue to take advantage of their hardware when using the new OS.

Incidently, I think it is important that this thing NOT require a microprocessor upgrade. I'd like to see it work with original Atari hardware, which is why I am currently trying to find a way for it to run on a 64K machine.

You can tell Atari is desprate for money *WHEN*... :)

They can't sue for somebody else using 9 pin joysticks.. they might as
well sue every company that makes a 9pin external peripheral cable. I
think Panasonic made the 3DO with male 9-pin controllers, didn't they? And
scrolling?!? uh.. hello.. that's a basic function of.. oh.. EVERY game on
the market. I'm pro-pirate. It's easier to get software, and i have tons
of it, most of which I got for free(for Atari and IBM) simply because it's
so easy to remove copy protection.

Think again Chris, I haven't seen the patent myself, I've just heard references to it, but it is my understanding it covers something like using 4 bits of logic to define an 8 axis of direction joystick. This dates back to the Nolan Bushnell days of Atari. I haven't talked about this with any of my patent attorney friends, but from conversations I've had with them over the last 20 years I'd bet dimes to dollars this thing is enforcible. Sega didn't give them 10s of millions of dollars for the fun of it. I've never seen a case like this go to a court judgement, but what I've heard is the patent holder can either stop the company from doing anything, something like a court order to stop all manufacturing, or win an award of approximately 7% of the infringing companies gross. Ditto for some of the other patents, but people do get the right to challenge the claims made in the patent. For instance, if Sega could have cited an earlier example of the technology the patent would have been disallowed. There are advantages to being the first video game company since everything you do is new. Bushnell was an engineer first, so he recognised the value of what the company was creating & took the right steps to protect it. Look at the bottom side of anything Atari, there will be references to these patents. On the bottom of an 800XL there are 14 US patent citations alone *including* the joysticks!

1506. 1050 Drive Problems

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-24 00:00:00 UTC
From: cmwagner@news.gate.net
Message-ID: <3v11qv$1emu@seminole.gate.net>
Source record: 89678

I ran 1050 diagnostics. Here is what I got...

invald command test - pass
write protect test - pass
motor start test - fail (executed test twice, so it seems, no results on
second run, but the motor was running when the test was executed <it did
start the motor>)
motor speed test - fail
step/settle test - fail
track 0 test - motor is still running, drive is hung, diag is hung.

Does the heat sink usually get hot within 5 minutes? This one did, and it is
blazing hot. I check some of the power transistors (Q7 and Q8, Q6 is too hard
to check, behind some of the control wires), since I can't remember which
pin is which, I am guessing that the emitter of Q7 had 5.11VDC, and the emitter
of Q8 had 12.3VDC, I checked pin 14 (seems that is where +5V is supposed to
be (why?) it was a nice even 5.0VDC.

Source record: 89684

Glenn Saunders <krishna@primenet.com> writes:

>exciting. If it means losing some backwards compatibility, so be it.

I don't believe we're talking about losing "some" backwards
compatability -- we're talking about losing it all. This OS would only
be used for new software written for it (if any). When a user wants to
use any existing progams, he would have to load the old OS - if he wants
to use new programs, he would have to load the new OS.
The only reason I use a different DISK operating system is because
SpartaDOS X runs with virtually all the software I use. I wouldn't want to
switch back and forth between DOS's, so why should I wish to switch among
OS's?
If the new OS could have a built-in switch that would allow one to
go quickly from new to old OS with the stroke of a key sequence or somesuch,
the utility of the new OS would be greatly increased.

Hello ALL,

I there someone who can help me......

I only have a E-mail account on internet but I like to get some files
from the atari archive.
I have try to send a msg to the bart mailer but he don't reply to me,
can anyone check if he still works ??
Or let me know how I can get files from the archive by mail ?

>>>>> "kendrick" == William Kendrick <kendrick@zippy.sonoma.edu> writes:
In article <3upvi4$ogh@nic-nac.CSU.net> kendrick@zippy.sonoma.edu (William Kendrick)
writes:

kendrick> Brent- I agree with a high level language to support this..
kendrick> but one problem is not everyone likes to stick to high level
kendrick> languages - or any particular high level language...

Sure. The point I wanted to make that if we started by hacking the
pseudocode machine for CC8 to "flatten" banked RAM and support multitasking
we'd be one step ahead of the game since we'd be STARTING with a high level
language that also happens to be the standard on most contemporary
platforms. There's no reason we couldn't support inline assembly, either,
though getting that to multitask nicely would make things more complicated.
Assembly code would have to follow some strict rules to cooperate with the
OS, too. But that probably goes without saying.

kendrick> ahh... but doing it that way would be the downfall of the
kendrick> thing UNLESS EVERYONE who wrote a program for it supplied the
kendrick> source code... what if we wanted to upgrade or change the way
kendrick> things work??? Recompiling would have to take place once the
kendrick> compilers and assemblers have been updated. <sigh!> And what
kendrick> if you accidentally ran a program compiled under WHATEVER
kendrick> v.0.1 but your system is currently executing managers and
kendrick> other software running WHATEVER v.0.2 !?!? Opps!! :(

So you have stuff in your code saying what version of the libraries,
etc. that you've compiled your code under, and if your code was compiled
with incompatible stuff, the OS just refuses to run it. That's the way
most contemporary OSes do it.

kendrick> Soooo... it should be a Sweet16 program, unless people can
kendrick> really stand 6502 with banked. (I don't really think I
kendrick> can.. but of course, I'm getting a Sweet16 :) :))

The advantage of the design I've proposed is that it will run on a 6502 with
banked memory, but could be rewritten for much better performance running
the same code on the 65816 with linear memory. And if you provide
facilities like I think AmigaOS did for a program to temporarily take over
the whole system then you get all the advantages of a 65816 with the
additional advantage of having a multitasking environment with high level
language support for development.

>
>
>>>>
That's 30 pin and 72 pin SIMMs. The 30 's are 8 or 9 bit by XK or Megs.
The 72 pins SIMMs are 32 or 36 bit by XK or Megs. X being 256K, 1Meg, 2Meg,
4Meg or 8Meg. So saying, the 72 pin SIMMs are 4 times larger capacity. The
difference of 8 or 9 and 32 or 36 is that some include 1 parity bit per byte and
some don't. (MAC SIMMs don't but they are pin compatible.) Also, a lot of Clone
manufactures are dropping Parity checking and are using just 32 bits per SIMM.
Cheaper and the DRAMs are so much more reliable these days.

Cool Emotions dies on part 2 and 3 of side 1 and part 2 of side 2..
this is because of NTSC vs. PAL :(

BUT! They (Hard Soft) were VERY COOL... they let you skip parts of the
demo.

Simply, upon booting one of the disks, hold: OPTION + SHIFT + NUMBER

where "NUMBER" is which part of the demo for that side you wish to see.

So, on side one, to get around the PAL-only stuff, hold OPTION+SHIFT+4
On side two, hold OPTION+SHIFT+3 to get past the 2nd part (that dies)

good luck!

Source record: 89692

I've been looking for some various pieces of hardware/software, new or used.
Can anybody help me? Innovative Concepts used to carry some of the stuff,
but they went out of business. Here's the list...
YeMaCyB- A printing utility that prints Micropaint pictures on your dot
matrix printer. It sounds like a wonderful program per the Innovative
Concepts catalog description, but I haven't been able to find it. Mark Elliot
is anything but co-operative in helping. I cant't really blame him though.

Easy Scan II- Another I.C. product. scans pictures/text into computer.

Transkey- Adapter board to hook IBM compatable keyboard to your 8-bit.

VoiceMaster Software- I have the original VoiceMaster. (not Jr.) It has
no software, rendering it useless. Covox told me several years ago that
they consider it PD. So if anyone has a copy, please Xerox me one! :-)

If anybody has so much as a minute clue on any of this stuff, pleas let
me know!! Much thanks in advance!!

Many thanks to Bill Kendrick for his generous offer to help me do the above. (He's downloading the appropriate files to disc for me -- nice guy, eh?) Unfortunately, I haven't heard any comments from others in the group about online services. I took the <info@delphi.com> address from one of Joe Walsh's posts and have asked that company for some information, but I'd *still* like to hear from someone about their experiences. How about it, Joe? Is Delphi Atari8-friendly? Anyone else? How about Compuserve? GEnie? I guess Prodigy and AOL are out (I test-drove the latter for a few weeks with my Mac and bailed out). I'm encouraging someone to stay with Atari-8 here, how about a little assistance, folks? Pretty please?

Like many others, I stumbled onto this group shortly after getting hooked up to the net, and I have been moved to unearth my old Atari 8bit stuff. I discovered my original Atari 800 with bit-3 80 col board and program recorder, and my later 800xl and two1050 disk drives, and accessories such as a P:R: connector, a Proburner and the Pill. The 800xl has two extra switches on the side, and I remembered that one was for OmnimonXL. I took the case apart and discovered I had upgraded the machine to 256K and the OS consisted of three chips soldered together piggyback style. I figured out the switches and now can get Onmiview to appear, as well as OmnimonXL, as long as the drive is switched off. It's a bit embarrassing, but for the life of me, I can't remember what Omniview does, or how to access it with the drive on, etc. Can anyone help?

I have recently expanded my 8bit collection with an Atari 800 (48K) that I got in mint condition for $5 (Cdn) at a thrift store, and a 130XE with 1050 drive for $35 (Cdn) in the bargainfinder, plus a few carts at $0.50 each.

If anyone can help with Onmiview, it would be much appreciated. Thanks in advance,

Roger

Hmmm.... I remember there was some product that had you attach a photodiode to the print head of your dot-matrix printer to use it as a scanner. Maybe that's what the easy-scan was. There were also a couple magazine articles, at least one in an Atari mag, on how to do this with homebrew stuff.

If both cartridges FIT in an Atari (any Atari), if one does work, it could be broken. Try cleaning off the connector using a soft, clean swab. I'm no expert on cart cleaning, but DON'T use harsh abrasives! Unless something gooey got stuck to it, you won't need to be too rough to it anyway!

Atari XL* carts are small, with 15 strip connection points on each side of the connector card. Many older ones say "<< Left Cartridge" on top.

* XL, in this context, is short for: 400/800/XLs/XEs

Good luck!

If all you want is mail, I could not reccomend a Waffle board any stronger!
If you go with an online service it will cost you a minimum of $20/month
& I know I used to average about $70/month on Compuserve. Waffle boards
are typically run on an older IBM & I haven't seen one yet that asks
for money. Your son should be able to find one in a local news paper or
a ref to one on a local bbs. I have both an account on Portal & I'm
a member of two local Waffle boards. The reason is the software on the
Waffle boards is just easier to use for both the email & newsgroup functions.
I also have a ref doc for how to perform most functions from an email
account. If only because I have sons myself, you should try out your
theory your son will stay in touch via email. My kids (& nephews & their
friends) tend to just go straight to chat areas or a local bbs that support
chats. I think even fido net supports internet email, but the mail tosser
seems to be difficult to use relative to a Waffle board. Just tell your
son to look for a list of local bbs(s) that offer internet email & he should
be able to hook up to something.
Rick

1538. Re: 1050 disk drive

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-25 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3v3cg9$fu8@nic-nac.CSU.net>
Source record: 89710

Anyone with a PC and Atari 8-bit anywhere next to each other should,
unless their PC is dedicated to, say, being a BBS, get an SIO2PC setup.

This involves an "SIO2PC" cable (SIO (13-pin) plug on one end, RS232
(9- or 25-pin) plug on the other end, some electronics in between) and
a program, "SIO2PC" or "Atari Drive Emulator", running on your PC.

With it, you get:

0- to 4- drives at a time, each numbered anywhere from "D1:" to "D8:"
Optional P:rinter emulation (print through to: PC printer, PC file or
PC screen; with or without translation of things like: EOL->CR or CR/LF,
Atari TAB->PC TAB, strip 8th bit)
Possible optional R:S232 emulator (access PC's other COM port(s)) using
"Atari Drive Emulator" (coming soon I hope! :))
Disk images of up to 16MB in size, or as small as 128 bytes(!).
Load disk images into RAM if they fit (SIO2PC only, I think)
Write protect disk images ("Atari Drive Emulator" only)
Access your PC's files directly:
Navigate through your PC ("Atari Drive Emulator" only)
Install PC files as disks
Write files to the PC (using special software with SIO2PC, or
sending them to a non-translated P:rint-to-PC-File; or with
the PC "mirror" navigation of "Atari Drive Emulator")

That's about it.

The directions to build the cable and the SIO2PC software are available
in the self-extracting-ZIP-for-PCs: sio319i.exe

Atari Drive Emulator is somewhere FTPable as well (not sure what directory
it has ended up at, but I'd assume "Sio2pc", just like the versions of the
SIO2PC software).

FTP them from: atari.archive.umich.edu/atari/8bit/Sio2pc
or: amiga.archive.umich.edu/atari/8bit/Sio2pc
but note that the "cd" command is messed up
or: from one of the Umich mirrors
Gopher from: gopher.archive.umich.edu/Merit Arch's/Atari Arch's/8bit/Sio2pc

Also, the standard Atari disk image (which was around long before SIO2PC or
the Atari 8-bit emulators) is ".DCM" - "DiskCommunicator". This can of
course make boot disks. To boot your Atari with a DOS, you'll need a DOS
disk. Some DOSes available include: Atari DOS 2.5, MyDOS 4.5x, SpartaDOS 3.2x
(where "x" is some number or letter). They're in "Oses" and "Fte" directories
at UMich (right under `8bit').

If you want to make the DIskComm. ".DCM" image into an ".ATR" image - the SIO2PC format - use either:

dcm2dsk for DOS
or dcmtoatr for Unix and MSDOS

ALSO available at Umich...

Good luck!!

-bill!

Michael Ellis <michael@anest4.anest.ufl.edu> writes:

>1.76MHz and doing all of their work on three 8-bit registers really need
>machine-language-based software. Indeed, all of the code I write will be
>machine language -- be it an OS or an application.

Yay! Glad to hear you say that about assembly. I agree that it
is the one, true best language for 8-bit systems. Our computers are just
not capable of dealing with the bloat that comes with using high-level
languages. Let me amend that: they're capable of dealing with it, but the
don't deal with it *well*. :)

>Incidently, I think it is important that this thing NOT require a
>microprocessor upgrade. I'd like to see it work with original Atari
>hardware, which is why I am currently trying to find a way for it to run
>on a 64K machine.

Yay! again. While I still don't see a need for another OS, if one
is to be written, it should most certainly run on the standard Atari machine.
If a processor upgrade is required, it is just going to fragment the userbase
even further: we'll have those who use standard equipment, those who use
the processor upgrade and the old OS, and those who use the processor upgrade
and the NEW OS. Not to mention all the fragmentation all the other variables
(such as RAM upgrades and HD usage). We don't need yet another product
to fragment us further.

1540. Atari ROM cartridges

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-25 00:00:00 UTC
From: Mark Smith <mark@te.rl.ac.uk>
Message-ID: <3v2ba8$1g0k@unixfe.rl.ac.uk>
Source record: 89712

I've got pitfall and pitfall2 ROM carts. The question is, what machine are
they for? Pitfall works on an 800XL, but pitfall2 doesn't.
Neither work on a plain old 400.
They've got no markings on them to say which machine they are for.
Any clues?

Please reply by email.
Thanks!

Regards,
Mark Smith, e-mail mark@te.rl.ac.uk

>applicatins twice as quickly? I didn't know that -- I thought it wouldn't
>handle that stuff as well as that. What about old games and such that are
>dependent on the speed of the processor?

Oops, I didn't mean it to sound like that! If you run the programs
without any modifications, they will run exactly the same speed on the
65816. However, very simple code changes can use the 816's block move
instructions to move data over twice as fast as loops on the 6502. The
Sweet-16 comes with an example that shows how to patch TextPro, and most
any other program that uses memory moving.

There is also the possibility of running the 65816 at a higher clock
speed, which gives you more possibilities for running existing code
faster.

> I can see the use of a new video chip for programming and other
>such things. But, I seriously doubt whether it is a worthwhile thing for
>a programmer to support == the market would be tiny.

There are still multiple people working on telecom software, so I think
this would get updated. I think JVIEW would get updated. There's probably
a good chance for TextPro. E: would support many editors and programming
languages. I think anyone that made such a device would make sure free
units went out to programmers that had good applications. And I don't
think there would need to be too many applications to make the board
worthwhile, since there are only a few areas where the 40 columns is the
biggest disadvantage.

>>RAM-
>>Well, it seems like I've never really needed this. I could put multi-

>to justify the expense). But what about before you had the HD? Didn'T it
>bug the heck out of you to have to compile from disk and to disk all the
>time?

I bought one of the very first LE Systems (Leading Edge at the time) floppy
interfaces from Dave Small. It was about 25K/Second, and so I've had pretty
high-speed access to my data since 1981-1982 or so. I always considered RAM

disks to be too volatile for any programming work. Heck, I now consider _floppies_ too volatile for programming work. I hate loosing data.

That being said, I have always programmed in a modular fashion, and rarely have ever needed to assemble from disk or to disk as a result. It all fit in RAM.

>Space is cramped as it is! :)

I have 8 operational computer systems in an area roughly 9x9. Don't talk to me about cramped! :-)

>free!

The price is right. :) And, that would make it possible for the
userbase to be larger. It's another of those razors/blades issues: give
the OS away, then charge for the apps that require it. If you get a ton
of people using the OS, you'll have a larger market for your apps.

>AND - the interface the OS presents (and the programs use) should NOT ONLY
>be SIMPLE to use (point/click, menu-bars, etc.) BUT be USER-REDEFINABLE!!!

Source record: 89715

I have a broken 1050 diskdrive. When I power up, the on light comes on, and sometimes the disk-operating light will come on for just a split second, but then it stops. It never looks again for a disk.

Does this sound like a fixable problem, or is the motor just worn out? Does anyone repair these things, or who might want to buy a broken drive?

I have another dirve that whistles somewhat while it is spinning the disk. This makes me a little nevrvous. It reads fine, but I wonder if the motor on this one is about to go also. Any suggestions as to how I can lubricate it or help fix the whistle?

Thanks,

Steve

That's the reason I upgraded from Turbo C to Borland C -- the latter
comes with an assembler, a profiler, etc. etc. It's a really good deal.
But you are right -- it's bloated as all get-out. ;)

>fooling with the idea of a 3d rogue clone for the 8 bit. The few people

>finish something in the gen're.

Sounds like a great idea, Rick!

I'm waiting for my Yorky 256K RAM upgrade from Rich Gore to arrive.
Once I get it and can use that expanded memory for a RAMDisk that will
speed up my assemblies, I'm going to jump back into my artificial life
experiment. I just thought of a way to make it take MUCH less memory. I'm
still learning assembler, but I think my idea is very possible. It requires
extensive bitwise operations, however, which are not something I have messed
with much before. So, we'll see how it turns out. :)

I look forward to seeing you Rogue clone. Oh, and your graphics/
sound effects problems are the same ones I have. ;)

Hi, Brent.

Actually, I use my 8-bit as my primary machine. Since your post
makes the assumption that I do not, I obviously should have stated that in
my original post! Sorry about that.
Anyway, on to the response...

>floppy board instead so I could use contemporary high density ibm-style
>3.5" disks with my atari which would be of much more utility to me at this
>point than 150 megs of mass storage... Anybody wanna swap me a floppy

I used to think so, too, but I find that my two XF551's serve me
well enough. 360K really is a lot for an 8-bit.

>I'm not sure why people want a 65816 except that it is a neat hack. For
>those who program a lot in assembly, it's probably really cool to have all
>those new opcodes. The motivation for the stereo upgrade is similar. Also
>some european demos and music software use the stereo upgrade.

I'm still a beginner when it comes to assembly, so I can't say whethr
the additional opcodes will be an attraction for me or not. But, I can
see your point. I guess I am a purist, though -- I figure, if someone wants
additional opcodes, they should find a new platform. I know, that is totally
illogical and unreasonable, but that's the way I think of it in my own
use of the Atari.

>The reason for the PAL modification is to be able to run European software
>and demos that expect the vertical blank to be at 50hz. It's not really an
>"upgrade".

I agree....that's a CLEAR addition of utility. And it doesn't
"corrupt" the Atari at all.

>The Super-Video upgrade, on the other hand, simply fixes a lot of ugly
>PROBLEMS with the video amplifiers on XL and XE machines. If you use a
>monitor with an XL or XE it is a "must-do". You don't know what you're

>published in Atari Classics that a lot of people have done. You might
>prefer to think of these "upgrades" as "fixes" since they don't add any new
>"features".

Right again. If I wasn't so ham-handed with a soldering iron, I'd
do it. I would LOVE to have the SV upgrade on my 800XL. But, I'm a dune

(er,a dunce..a dune is something else entirely[grin!]) when it comes to hardware hacking.

>And as for talk of 80-column boards, those who use an 8-bit as their
>primary machine would probably prefer a fast 80-column display on their
>8-bit for telecommunications and text editing than to switch to another
>computer for those tasks.

Eh, the only two tasks I wish for 80 columns while doing are telecommunications and word processing. I have FT80 for telecommunications, and I have a XEP-80 if I ever REALLY want 80 columns for WP (I have AW-80, too) - though I don't hook the XEP-80 up (it doesn't like my Commodore monitor, and I don't want to buy another nor add a second one just for the XEP-80). When I use SynFile+ (database) and SynCalc (spreadsheet), I haven't ever had a problem with 40 columns.

>If you can see the rationale for a 256K - 64K = 192K RAMdisk what is so
>difficult to understand about someone wanting or needing a bigger one?

I can see the necessity for a slightly bigger one, depending on how complicated one's compile is (ie, lots of macros). But, for my applications, there is a point that is reached where it becomes superfluous. I understand J. King's need, as he ran his BBS from a HUGE Ramdisk. But how many people do that? So, what is a 1 MB RAMDisk used for? Like I said before, if it's just to run programs from, a floppy user would end up spending more time loading them into memory each time than he would spend using them. And a HDD user has such quick access to data on disk that he wouldn't NEED a huge RamDisk for program storage.
So, again, what are those huge RAM upgrades used for?

>Let's see, what other upgrades are there? If you've ever used a floppy
>drive modified for ultraspeed sector skewing, you don't want to go back to
>stock, trust me. And the old US doubler was pretty inexpensive. The US+

True. When I got my first disk drive with ultraspeed support (an Indus GT), I was AMAZED and pleased. I use the XF551's now, which are not as fast as the GT, but they ARE faster than a stock 1050, and I do like that.

>I think what you don't understand is that there really are people who still
>use their 8-bit as their primary machine. I don't anymore, but I love

Again, this IS my primary machine (yes, I am using it even as I type this! [g]). I use my Atari for ALL computer applications, with the exceptions of: At work, I am forced to use the spawn of Hell known as MS-Windows, which requires an IBM Clone; my BBS is run on an IBM clone,as I love the software I use - if there were a way to support my MS-DOS-based callers AND if there was an equally great Atari8 BBS program, I'd switch ;)

>taking a soldering iron to my machines and fiddling around. I would agree
>with you that I don't see much need for a hard drive or an '816 or an
>80-column adapter for someone like me or you, but things like floppy
>upgrades, video fixes, OS upgrades, smaller RAM upgrades (at the very LEAST
>for 130XE compatibility so you don't have to have a junky XE around to run

>"130XE-only" stuff) seem pretty essential to the contemporary 8-bitter...

I think this is the primary difference between me and the majority
of the members of the 8-bit community -- I fear a soldering iron, while they
love it. :) I think you are right, upgrading is, for them, as much fun as
software hacking (mostly useless programs like display hacks and various
experiments) is for me. I do it for the sheer fun of it, and care not a whit
whether the stuff I produce is useful to anyone other than me, and even for
me the stuff I come up with is only useful in that it's entertaining to
watch them run. :)

"He" (the user) does not switch between the two modes of 65816 emulation..
the programs do. If a program has a need for 16-bit registers, it turns
them on and uses them. The only person losing is the programmer, but not
exactly by much!! (the gain is still very positive, even with the loss of
having two modes!)

If I want 16-bit registers, i have to turn of interrupts or some such thing..
If I want standard Atari XL interrupts, I lose 16-bit registers.. no biggy,
IMO!!!

Like when the XLs came out, some software didnt run.. that's because some
software didn't conform to the "standards". Between 400/800 and XL/XE,
programs which didn't stick to the rules when it came to the OS no longer
worked on the XL/XE (without the 'translator' program).

Betweet 6502 and 65816, programs which didn't stick to ONLY legal opcodes
(ie, the ones which were defined as true 6502 instructions) will not run
with a 65816 (because all of those old illegal instructions have been
replaced with true 65816 instructions - and they of course do things that
the 6502 doesn't when it's given the same opcode).

I can see a translator type program possible in this case as well, however.
Say I wrote a 6502 program which used opcode $XY, and $XY is an illegal
opcode. It DOES something.. I know that, which is why I used it.. it
may have saved me a cycle or two in my program.

Now, with a 65816, opcode $XY does something completely different, and locks
up my program. I could replace opcode $XY with a replacement (set of)
LEGAL instruction(s). Now, if >I< can do it, I can make a PROGRAM that
can do it... See where I'm going with this?

But I'm honestly not sure how much software does really use illegal 6502
opcodes. And folks, no, I can't write this 6502-65816 translator,
sorry. :) (I don't even know 6502, let alone illegal 6502 codes or 65816
codes!!!)

(I will one day, though.. unless someone comes out with Sweet16-Action!
or something similar! muhahaha! :))

Q7 is a 7805, 5 volt regulator and Q8 is a 7812, 12 Volt regulator.
Pin #3 is the output pin on both. Q6 is a TIP110 which along with the LM2917
supply the 12 volts and controls the speed of the drive motor. Did you take the
Voltage reading on Q8 while the motor was running?
If possible, try swapping out the mechanical deck. If the 12 Volts
drops off below 12 volts when the motor is on - - , well, C68 of C71 are possible
baddies.

Message-ID: <3v2b71$1g0k@unixfe.rl.ac.uk>
Source record: 89726

I have a 1050 disk drive which I'm trying to use with an 800XL.
Do I need some sort of bot disk for it? If so, how would I get it
onto a disk - i.e. what sort of format is it? and if the files were
on the internet somewher, is it possible to transfer them to a PC
and then to the Atari via some sort of serial cable?

Regards,
Mark Smith, e-mail mark@te.rl.ac.uk

>someone to stay with Atari-8 here, how about a little assistance, folks?

Your best bet is to go with GEnie or Delphi. Delphi has a good sized file area and is VERY easy to use on the 8bit Atari (use Bobterm or ANY other software). If I had to start all over, I'd probably start with Delphi, then slowly move over to GEnie.

Delphi is best when it comes to overall Internet access and ease of use on an Atari 8bit system.

Message-ID: <1995Jul25.213810.8289@wariat.UUCP>
Source record: 89729

I don't have an Atari set up right now. I'm into too much summer projects, so I had to make workbench space. When I set up my 8-bit, I gotta have my one meg MIO. Can't live without it. My usual setup is the MIO, 130xe (I also keep a omnimon 800xl handy and just plug it in when needed.) A doubled 1050, stock Indus GT and a third real floppy, a Rana. That gives me 8 floppies (I put 5 192k drives on the MIO). I have a boot disk with a 'fast fingers' (patched, not the original that was messed up.) file that will automatically configure my MIO, format all five MIO ramdisks, copy all my 'must have' files onto ramdisk that ends up as boot disk, (all the time automatically swapping ramdisks around), alphabetically copies those files using a SpartaDOS batch file, and ends up with 'boot x32d.dos' and swaps in MIO ramdisk two to be drive 1, and does a cold start. I never touch the machine for this whole setup, which takes about maybe 4 minutes. I use a 2400 baud modem and a SG10 sometimes.

Source record: 89730

I forgot to mention my NEC composite monitor, R-Time 8 cart and I
usually have a Y-adapter to my old tube type audio amplifier and
speaker for better sound when I want it.
This makes me look forward to setting up again. Got a few summer
projects first, though.
That 'fast fingers' thing, it also erases files along the way. The
only thing my startup.bat does on booting from MIO ramdisk is turn KEY
OFF.
About '
about 'fast fingers' it was a program from Antic I think that allows an
autorun.sys to type anything that you would type on the keyboard on
bootup. The original had a weirdity that allowed the correct checksum,
but there was an error in the code. Shows the weakness of the checksum
that (maybe it was ANALOG) the magazine was using.

All right, I'll take a look at integrating GR.10 (where 0 in all 3 screens turns out black) into JVIEW. I was slashing into the code anyway to try some Floyd-Steinberg dithering (help!) and other things.

I have also just received the Sweet16 upgrade (thanks Mike!) and will be poking around with that. Any JVIEW users out there using the 65816? Is it worth doing a rewrite? It should execute faster.

Hello Bill, Thanks for the reply and the info. That goes to show you what I know. I saw someones message about it and they indicated they were out. I did send Ftooned a message about them. But they never did reply to my question on them. I am planning on expanding my Atari system and wanted to find out what these units offered or if someone had them up for sale. I see now that they don't. So I guess like everyone else, I will have to wait to see when it does come out. Thanks again for the help, take care.

Apologies for the bandwidth occupation...

Looking for Pierre Wilkinson, apparently at the address
winkinsp@usask.ca. My replies to your earlier message keep bouncing.
If you're still interested in the two computers, drop me a line with
an address that you're sure will work. thanks

...and so the message isn't a total waste to others, I have
two spare Atari Power supplies to unload. (sorry cbm folk, I don't
have any extra cbm items)

The first is, from what I'm told, for a/the Letter Quality
Printer. (part number CO61636) The second is for for 800xl possibly
others too, but I only have an 800xl (I don't have the part number
for this one handy)

Send offers.

(I am using Clev. Freenet. The messages here seem old. I don't
think it is getting updated very often or something. This
msg. comes after two previous msgs. about describing my setup.)
I just gotta add. I also use a power strip that turns on everything
but the MIO and computer. And, BIG IMPORTANT, a 3 inch cooling
fan directed at my MIO and floppies. I learned the hard way what
not having a cooling fan can do to floppies (and don't want to
take chances with my MIO, which is on for months, sometimes years).

With all due respect to Mr. Kendrick's reply concerning the
SIO2PC setup (and if you're a hardware hacker, go ahead
and have at it), but I'll bet by the time you get that ready you
could have mail-ordered a bunch of disks to get you started.
Maybe some of the UK folks who check in here could chime
in with some local sources for you. Even if you're planning to
do the SIO2PC thing, I suspect the whole process would be
much easier if you had an Atari-format DOS boot disk to get
you started, if for no other reason than to verify that the 800xl
and 1050 are working properly.

Bill, minor addition, I've tried to download the SIO2PC 3.19 a couple of times from the archive.umich & it was busted. Finally got a good copy of of Xmission. There's several other files at umich that I've had trrouble with also, SD 3.2f & SD Disk RX. I think I also tried to get the source for MyDOS off umich to patch a bug or two & found it to be broken. I think these were the only files I've tried to get from umich in the last year so as a sample of good vs bad files, it doesn't look to good right now.

>of ascetic?

Since this new-CPU, new OS, new chip machine thread seems to be developing from the subject, it's beginning to sound like an alt.computers.homebuilt subject to me.

What's the point of a new OS, new CPU, and a system that's not backward compatible to Atari-8 users? If you can't run the old software, it's not an Atari anymore! If you want to build a new computer from scratch, have at it.

Just don't expect me to be overly excited about it - I use my Atari because I *like* the way it operates, flaws and all - this new setup everyone is postulating may as well be a TI/99a for all it matters to me - it won't run the software I bought the computer *for*.

Sorry to rant, but this seems like a rather arcane, and pointless wish-list discussion to me, and has nothing to do with Atari-8.

1570. ULTIMATE VIDEOGAME AUCTION DAY 4

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-26 00:00:00 UTC
From: jrm8248@u.cc.utah.edu
Message-ID: <3v4ap0$pgj@news.cc.utah.edu>
Source record: 89740

I have been trying clean out my closets and I have decided to have an auction.

HERE ARE THE RULES:

1. This auction is from Friday, July 21 until Friday, July 28 at midnight
mountain time.

2. Current high bids will be posted daily on this newsgroup.

3. High bidders will be posted by their email name unless otherwise specified.

4. When sending a bid, your subject must be AUCTION BID .

5. Minimum bids will be $1 unless otherwise posted and bidding increments will
be $.50 all in US Dollars.

6. If two people bid identical bids, then the person responding first will get
credit for the bid.

7. Shipping will be $2.00 for the first cartridge + $.35 for each additional
cartridge. All cartridges will be shipped through the US Postal System anywhere
in the Continental US. Other areas will need to make special arrangements for
shipping.

8. On Saturday, July 29 I will post the final bids and each bidder will be
contacted individually for payment and shipping. Money Orders (sorry no personal checks) are the preferred form of payment, but cash is always accepted.
Payment MUST be received within 7 days.

9. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST PAY FOR YOUR ITEMS, OTHERWISE
YOUR POSTMASTER WILL BE INFORMED AND YOU WILL BE BARRED FROM FUTURE AUCTIONS!!!

1571. Re: Describe your Atari setup!

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-26 00:00:00 UTC
From: Steve <100733.2604@CompuServe.COM>
Message-ID: <3v429eghn1@mhafm.production.compuserve.com>
Source record: 89741

My setup is nothing like yours mate:

Just an 800XL+1300XE, 1050 + XF551, Star LC10 Printer.

What modem are you using?/via what provider?

FOR SALE - ATARI 8-BIT ACCESSORIES

Atari CO17945 9v AC power supply (NEW) $7.50 (1010/1020/1050,etc.)
Computer to TV Switch Box $1.25

FOR SALE - ATARI BOOK

Atari XL User's Handbook (WSI) $5 (good condition)

FOR SALE - ATARI 8-BIT SOFTWARE

EDUCATIONAL:

Turtle Tracks (Scholastic) $3
USED: Facemaker (Spinnaker) (cartridge) $3
USED: Math Encounter (cartridge) $3
USED: Music Composer (cartridge) $3

GAMES:

Adventure Master (CBS) $5
Astrology (Antic APO167) $3
Crypts Of Plymbous (Cosmi) $3
Encounter at Questar IV (Artworx) $3
Lords Of Conquest (Elec. Arts) $5
Touchdown Football (Elec. Arts) $5
Winter Challenge (Thunder Mtn.) $5

UTILITIES:

Get Rich! Insurance Planning (Arrays) $4
Megafont II/II+/Font Sim. package (XLent) $4

Indus DOS XL Master Disk/GT Estate Word Processor package $3

ALL 8-BIT SOFTWARE ONLY $35 PLUS SHIPPING

All items include original docs unless noted, and some are new in original
shrinkwrapped boxes. Inquire for specifics on any programs.

If interested, please contact Lawrence Estep at 71450,1050 on
CompuServe or 71450.1050@COMPUSERVE.COM on Internet.

1575. 800XL Deejay doc... READ ME

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-26 00:00:00 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <FG1VAJVAUp@stingray.manawatu.gen.nz>
Source record: 89745

For those of you who have tried 800XL Deejay - the program for 680x0 Ataris (e.g. ST, Ste, TT, Falcon, etc.) which provides up to 8 virtual disk drives and a printer for the 8bit Ataris - I have now pretty much completed a doc file in English for it.

It's not the most attractive, but if you use Deejay, then you might find it of use - if you find any errors, or have suggestions, please feel free to e-mail them to me, and I'll update the document. My address is at the end of the doc file below.

I hope no-one minds me posting the doc here, but it's the easiest way to get it to everyone.

Thanks,
Richard.

PS. I hope that you enjoy 800XL Deejay as much I as do - it's a great program!
PPS. No, I didn't write it, so I'm allowed to say that... =8-]

/--/
800XL Deejay Document...

Menu Commands:

Load config ^J
This command will alow you to load a previously stored configuration, which will decide which disks will be loaded, and which drives will be assigned to those disks.

Save config ^K
This will save the current disk entries, and which drive numbers are assigned to them.

Cycle windows ^W
Highlights each window in turn with each successive selection of this command.

Close window ^U
Closes the current highlighed window.

Quit ^Q
Exits the 800XL-Deejay.

/*** Disk ***/

New disk ^N
This creates a new disk entry in the main window - the disk will be labelled New Disk, and will be unformatted - remember to format the disk

(see Format), before use.

New V-HD ^V
This stands for virtual hard-drive, and creates a new entry in the main window. The directory is shown, and can be changed by either a right button click, or a double click on the entry. The current directory shown, will be accessable from DOS on the 8bit, allowing all files in that directory to be accessed sequentially, and in a read-only manner. This is very helpful when you have a lot of .com or .exe files that you want to be able to use quickly, without having to import them into a disk.
Note, you can change the sector format of a V-HD, by selecting the V-HD entry, and choosing format from the disk menu - this will provide the option of changing between 128bps (bytes per sector), and 256bps.

Load ^O
This will pop up the file selector, and allow you to choose a disk to place in the main window, for use. Note, Deejay disks have the extender .DIL, and their corresponding labels have the extender .DI To allow the disk to be accessed by the 8bit, you must first select a drive number for the disk. (See the section on Setting Drives)

Save ^S
This saves a disk to a file on the ST. If no current filename has been selected, it will function in the same manner as "save as".

Save as ^M
This pops up the file selector, and prompts for a name to save the current highlighted disk as. The disk will be saved as a file with the extender .DIL, and its label file will have the same name, but the extender .DI

Remove ^R
This removes the currently highlighted disk entry from the main window. It does not, however, delete the file from the ST.

Select all ^A
This highlights all of the entries in the main window.

Info ^I
This brings up information about the currently highlighted entry, such as the disk format, disk usage, etc.
Note, this option allows you to set whether a disk is write protected, or not. Select the entry you wish to write-protect/unprotect, and then go to the info option, and click in the write-protect check box. A check in the box means the disk is write protected.

Directory ^D
This will show the directory of a disk entry, providing it is in either a DOS 2/2.5 or MyDOS format (root dir only).
Note that in the directory window, more commands are available by double clicking within the window - see the section "Directory window commands".

Label ^L
This allows you to change the disk label that is shown in the main window,
and also provides you with the ability to list the contents of the disk,
or make any notes about the disk - this label will be saved along with
the disk, when either the save as, or save options is selected.

Clean ^C
This will zero the unused sectors on a disk without deleting any files
currently in use. This allows Deejay to optimise the storage of the
disk (by ignoring empty sectors).

Format ^F
This option will format a disk and provides the user with several
pre-defined options, or the ability to select an exact disk size from the
format dialogue box.

/*** Options ***/

Status display ^Y
This toggles between showing the disk sector number currently being, or
last accessed by the 8bit, as well as which this operation was - e.g.
write/read/status and so on. If shown, the status will appear in the top-
right of the main window.

Misc ^X
Filename conversions:
Diskfiles (default, *.DI)
Diskfile labels (default, *.DIL)
Extensions for textfile recognition (for use in the view file option)
Fileviewer to use.

Behaviour ^B
Options for whether to request confirmation on:
Delete/move/copy/export/import
Which options the right mouse click/double clicks perform on the disk
icons, and disk/V-HD entries.

Font/Colour ^E
Select which font, font size, and colour to use in Deejay.

Dialogues ^G
Select dialogue box options and appearence.

Timing/Emu ^T
Option to emulate 8bit drive sound through via DMA (only Ataris with DMA
sound - e.g STe, Mega-STe, and Falcon).
Set polling time, and amount of time before returning to the Eventloop.

Printer ^P
Select whether a printer is active or not.
Select which device number is to be used as the printer (1-9), or X
indicates any device number (i.e. any calls to the printer).
Option to dump to a file (all prints will be appended to this file).
Option to select the file to print to.

Option to clear the file.
Select whether to convert EOL (End Of Line), and TAB characters.

Load setup ^H
This option will allow the user to load new settings previously saved.

Save setup ^Z
This saves the current settings used by Deejay - such as the default format, and whether the status display is on, etc.

/*** Directory window commands ***/

Import Alt M
This option allows the user to include a file from the ST, as part of the 8bit disk - after choosing a file from the file selector, Deejay will ask the user if the file is text, and if it should be converted to another text format (e.g. between 8bit and ST text formats).

Export Alt E
This option allows the user to save a file from an 8bit disk, to the ST, as a separate file - as in the Import option, the ability to convert from one text format to another is provided.

Delete Alt L
This option allows the current selection from the directory window to be deleted from the disk - if a deletion is made, then this will only affect the disk stored in memory, and will require re-saving before any changes become permanently stored.

Info Alt I
This option shows the file attributes, and whether or not a file is write-protected. The file can be renamed, and write-protected from the info dialogue box.

View Alt V
If the file selected in the directory window is a text file (acceptable file types are listed in the Misc dialogue in the options menu), then this option will allow the user to view the file, as text.

Invert sel Alt R
This option inverts the current selection, so that all files currently selected, will then be unselected, and all files unselected, will become selected.

Select all Alt A
This option selects all files in the directory.

Numbers Alt N
Toggle whether the directory entries have numbers infront of them (i.e. 1 to the number of files in the directory).

Bytes Alt B
Toggle whether the directory entries have their file sizes listed.

Sectors Alt S
Toggle whether the directory entries have their size in sectors listed.

/*** Other commands ***/

To select an entry in the main window, or directory windows, either:
Use the up/down cursor keys to move from one entry to another, or;
Use the mouse, and click with the left button, on an entry.

To write protect a disk entry:
Select the entry you wish to write-protect/unprotect, and then choose the
info option in the disk menu, and click in the write-protect check box.
A check in the box means the disk is write protected.

/*** Setting Drives ***/
To set a drive to a particular entry in the main window, either:
Select the entry you wish to use (using the above procedure), then press
control-and the key representing the drive you wish to select
(e.g control-1 is drive 1, and control-8 is drive 8), or;
Drag the icon representing the drive you wish to use, onto the entry.

To temporarily remove a drive, click the right button, or double click,
over the corresponding drive icon, and see the drive toggle from black to
grey - black indicating that the drive is available.

/*** The disk icons in the main window ***/

To quickly create a new disk, or new V-HD (virtual hard-drive)...
Drag the clear disk icon into the main window by holding the left mouse
button down, to create a new V-HD.
Drag the greyed disk icon into the main window by holding the left mouse
button down, to create a new disk entry.

To quickly format a disk, or open a new disk:
Double click or click right mouse button over the clear disk icon to
format a disk entry.
Double click or click right mouse button over the greyed disk icon to
open a new disk.

Note that these default options on the disk icons can be changed from the
Behaviour dialogue, in the options menu.

I don't know, isn't Q8 a steady +12VDC? Or should I be looking on Q6 for a
voltage drop?

> If possible, try swapping out the mechanical deck. If the 12 Volts
>drops off below 12 volts when the motor is on - - , well, C68 of C71 are possible
>baddies.

I did check Q8 a few minutes ago, I had my meter on it when I turned the drive
on, which runs the motor, but it fluctuated 0.02VDC, that was it. It fell
to 12.28VDC, and jumped back to 12.30VDC. Do you know where I can get a
service manual for the 1050? Does anyone like Best Electronics sell them
still?

bill> stuff run!)

Ok, I am starting to get frustrated with this whole thread. Mark (as well as whoever made that great crack earlier about "JCL support") is right insofar that some of what's been fueling the discussion has been pointless fantasizing. However, Bill, you've hit the nail on the head: I would go so far to say that the whole POINT of a "new' OS or major OS extension for the 8-bits SHOULD BE to provide a better environment for software development. PERIOD. I'm not interested at all the original proposal of a simple multitasker for specially written machine language programs. I think it would be a neat hack but I don't see much use for it.

What I would like, mostly from my experience running Linux on PCs is:

- at the very least, simple task-switching and virtual console support
- a Unixish shell & unixish file utilities
- an EMACSish editor, something small like "NotGNU emacs" or "jed"
- a reasonably complete C compiler (cc8 is already close enough to work with though an implementation of ANSI C would be ideal)
- a good fast assembler with a nice set of canned macros
- a real make utility

Only the first and last of these would necessarily require a new or extended OS. I admit haven't tried John Harris' assembler yet, which I believe incorporates a fast, clean editor. I will say that SpartaDOS 3.2 + TextPro + CC8 on a hard drive + the MAC/65 cart, though usable, leaves a lot to be desired as a development environment, at least for someone spoiled by the GNU tools under unix..

What I think is feasible in the short term if enough people want it to happen, and would be a big step towards the kind of environment I'd like on my 8-bit:

- an extension to the cc8 runtime code (which already implements a virtual 16-bit processor) and modifications to cc8 to "flatten" banked memory so cc8 programs can directly use expanded memory without any fuss. This would initially involve implementing a 24-bit (?) "virtual" address space which the virtual machine would decode into banked RAM.

- a real malloc() for cc8 (the one published in atari classics can only allocate page 6 memory)

This would provide us with the ability to write much larger high-level language programs than before, as well as potentially port stuff from other platforms. Also, the runtime code could be rewritten for the 65816 and flat 65816 memory for what would probably be an enormous performance increase (since the 65816 probably provides native operations for a lot of what the cc8 engine was written to provide) running essentially the same object code (it would have to be relinked with the 65816 runtime machine).

As cc8 stands, a reimplementation of the runtime code for better performance on a 65816 is quite feasible without getting into the guts of the compiler, but I think we'd all like to have a larger address space on expanded memory machines...

Is anyone interested in something like this at all, or am I spinning my wheels here???

Oh yeah, is the cc8 source code available? I don't remember. I bought the Deep Blue C source code ("Deep Blue Secrets") with Deep Blue C years ago when ANTIC was liquidating its software catalog but it's not free. I suppose if there's enough interest the authors of cc8 could probably be cajoled into releasing source...

Anybody up for getting the runtime source for the TurboBASIC XL compiler from Frank Ostrowski & co. and rewriting it for the Sweet-16???

Brent

Joe - since much of what a program will be doing is calling OS stuff ("draw window," "wait for input," etc.) why not this:

multiple versions of the same OS - the hooks which programs use are the same (they call "draw window" routine, it'll draw a window, it doesn't matter which version they use)

if I have a 64K machine with a floppy, I'll of course be CRAMPED AS HELL, but there will be a version which supports me

if I have a 256K machine with a hard drive, I'll be running a little slow, but there will be a version which supports me

if I have a 4MB Sweet-16 machine with a huge hard drive, there'll be a version which supports me

Hooks hooks hooks, I say.. modularity, easy upgradablity, etc... it's all a BIG FAT >> MUST <<!!

I do like the sound of those specs. However, I think we can all agree
that if 8-bit software is to work with most of the 8-bit machines out
there, it needs to conform to the paltry 6502's specs. Thus, we're back
to three 8-bit general purpose regiters, and a fixed, $100 byte stack.

Oh well... what can ya do?

;-)

Roger, hold down the <control> key & hit the A key, then press reset. That should bring you up in 80 columns. It also reverses the <option> key use in startup, hold it down if you want to boot basic. There are a few other advantages to the chip, for instance if you have an upgrade from Newell it has built in ramdisk handlers for doing stuff like making the ramdisk drive #1. It also has a built in terminal for use with an ATR8000.Rick

1587. T-34 - where to get?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-27 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3v7iqt$nah@nic-nac.CSU.net>
Source record: 89609

At this very moment I'm talking on IRC to a guy from Poland. I asked if he had seen T-34 and he said there are many game magazines in Poland and that a year ago he say it mentioned but he thinks it is still not out. I said it has been played in the US, so I'm pretty sure it has been released.

Has it? If so, where can one purchase it? (yes, I am PAL-equipped (thanks to Bob Woolley! :)))

I ran a disk cleaner thru mine, and it worked wonders. You could try it.

1589. Atari Basic manuals, POKE addresses

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-27 00:00:00 UTC
From: sharris@bobcat.ent.ohiou.edu
Message-ID: <DCDn7H.LCE@boss.cs.ohiou.edu>
Source record: 89611

I was unable to find my Basic manuals. Is there anything on line
that could help me refresh my memory with how to program in Basic
and what POKE addresses are for what?

And I'd also be interested at trying to get into assembly lang
programming for 800xl. Where should I begin?

Thanks for any help,

Steve Harris

The best reference I've seen for POKE addresses is Chadwick's _Mapping
The Atari_. As of April, I was able to get this at American
Technavision for $3 (actually $15 for 5 books); I'm not sure if they
still have these or if the price has changed if so.

: And I'd also be interested at trying to get into assembly lang

Find a good book on programming the 6502.

: My setup is nothing like yours mate:

: Just an 800XL+1300XE, 1050 + XF551, Star LC10 Printer.

Okay, I'm a latecomer to this thread...

In the bedroom: 800XL, 2 1050 disk drives, 1010 cassette drive, 1025 printer, 850 interface with 9600 bps modem, Commodore 1902 monitor, two joysticks, paddles and a trackball controller.

In the living room, hooked up to our 25-inch TV: 800 and one 1050, required since the XL won't run M.U.L.E, or a few other (mostly older) Atari games.

In a box at home: one sick 400, three 1010s, 1027 printer, three power supplies for the 800 and 1050, three switch boxes for the TV, four cheap Atari 2600 joysticks.

1592. Re: problems with bartmailer..

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-27 00:00:00 UTC
From: mcurrent@carleton.edu
Message-ID: <v01510106ac3d6b22dd9a@[137.22.11.119]>
Source record: 89614

bernard@twilight.xs4all.nl (Bernard Kok) writes:

>I only have a E-mail account on internet but I like to get some files
>from the atari archive.
>I have try to send a msg to the bart mailer but he don't reply to me,
>can anyone check if he still works ??
>Or let me know how I can get files from the archive by mail ?

I've been meaning to give it a try again, but last I knew BART had been
down for at least several months. It would be nice if Jody could comment
here about the situation.

Meanwhile, there other other general purpose FTP-by-mail services out there
that can be used to accomplish the same thing that BART does/did. From my
FAQ:

Subject: 3.4) How can I retrieve files from FTP sites by e-mail?

There are several general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet.

1) mailto:ftpmail@decwrl.dec.com with no subject line, and two-line
body with line 1 help and line 2 quit

2) mailto:ftpmail@grasp.insa-lyon.fr (body: help) Please, European
users only.

3) mailto:bitftp@pucc.princeton.edu (body: help or ftplist for a
list of anonymous ftp sites)

Of the mail-servers listed here, I recommend this "BITFTP" server. To help you
get started using it, try this example of retrieving files from the Merit/Umich
Software Archives (through the barnone.citi.umich.edu mirror site). Send a
message to bitftp@pucc.princeton.edu that says exactly:

```
ftp barnone.citi.umich.edu
user anonymous
cd /afs/umich.edu/group/itd/archive/atari/8bit
dir
cd Telecomm
dir
get ft80v037.txt
get icet.txt
binary
get ft80v037.arc
get icet.arc
quit
```

4) mail BITFTP@DEARN or to mailto:BITFTP@vm.gmd.de (body: help or ftplist for a list of anonymous ftp sites) (Europe only)

Let us know how it goes for you!

Source record: 89617

POKE addresses - by all means, get Mapping the Atari (Revised (XL) edition) and / or The Complete and Essential Map (a new publication from England (I think)). Mapping is probably still in stock at the major Atari 8-bit dealers like B&C Computervisions, BEST Electronics, etc. Check the FAQ. (part 2)

Assemblers for XL - There's MAE, a very good macro-assembler/editor for "XE"s (typically, Atari 8-bits with 128K or better RAM - I say "XE" because if a version of a program says "XL" it supports the additional 16K XLs provide over 400/800's and if it says "XE" it supports 128K RAM). Current (latest, as of a few days ago I think!) version is 0.96. It is available via FTP. Check the FAQ. (part 1)
Also, there's MAC/65, I believe it was the most popular macro assembler for the Atari back in it's hey-day. It's a cartridge and again can be gotten from major dealers. Check the FAQ. (part 2)

Good luck!

Chip side faces the rear end of the machine.

>Anyone know? Also, which of the four slots under the hood should I put
>the RAM boards in?

From the rear of the machine, the first three. I don't know if it matters
or not. It probably does. Do you have the OS/ROM card in this machine?

On a typical 48K 800 you have (starting from the front) OS card, 16K RAM,
16K RAM, 16K RAM.

I am always highly amused when people start demanding all kinds of GUI features on the 8-bit, because I have to believe that such folks have absolutely NO IDEA how much code it takes to do even the simplest GUI operations, much less a COMPLEX and CUSTOMIZABLE one! I don't have any figures at hand, but I'd be surprised if you had enough memory in even a 256K 8-bit to run the kind of GUI Bill is asking for, much less any apps along WITH the GUI! It's possible I'll go down in history as "the guy who said it couldn't be done," but then, I'm a skeptic by nature and "I'll be-lieve it when I see it!"

Shoot, while we're at it, how about arranging for the next version of the Atari emulator for the PC to provide an "expanded API" so that emulated Atari apps can use Windows features on the PC they're "really" running on? At least the GUI and its API are already WRITTEN...! :-)

Correct, Q8 Should be steady 12 VDC. Q6 Voltage will vary to control
the speed of the motor at 288 RPM. Once it locks in at 288 it should hold steady
at some voltage around 7 VDC (That's what my SAMs schematic says). I thourght
that when I checked the voltage was closer to 9 VDC.

>>>>>>
` On the broken Drive, the first think to do is to reseat all the
socketed chips under the shielding.
The other drive, try to determine WHERE the sound is comming
from. I have a deck here I pulled out of a 1050, the bearings under the disk
hub have gone out and it 'growls'. American Technivision has new decks
for about $20. The Seagate ones. If it is a World Technology version - -
well, I don't know where you can get one. I have swapped a Seagate into
one and with a little cutting of plastic inside the top, made it work.

I guess I don't see your point, Michael. C is a -compiled- language. That means that your C statements at some point turn into MACHINE INSTRUCTIONS. "Simply" create an ANSI C-supporting compiler that generates Really Efficient instruction sequences, and I should think the final result would run as fast as if you had hand-coded the ML directly. It's possible that I'm missing something, but if so, I don't know what it is and you should now enlighten me!

>> New graphics API to support things like autoscrolling larger images,
>> perhaps even making GED and CV into automatic modes.

"GED"? What's that? Oh, yeah, John Harris talked about that, what, a year or more ago now? Jeez, I've GOT to start keeping in better touch here.

>> At least some basic GUI functions.

I saw a demonstration of a "windowing device driver" on the Atari 8-bit, at least five years ago at a meeting of "ACORN," the Atari Computer Owners of Rochester, New (York). From what I could tell, it rendered its windows in GR.8 (Antic mode F), could put them at any pixel/line position, and could then render standard GR.0 (Antic mode 2) -looking text into them. I believe it could also draw graphics into them, but I don't recall that specifically. It could put up a maximum of 255 windows, which is what the demo program (language unknown) did, and pretty fast too (say, 5 seconds or less for 255 windows ranging from 1/10 to 3/4 the size of the screen, random sizes and positions with about one line of text each). I believe the thing also had the ability to render text at any integer multiple of the original font size, i.e. 2X, 3X, etc. Anybody else ever see this? Know where it came from? Think it interesting/useful?

>Incidently, I think it is important that this thing NOT require a
>microprocessor upgrade. I'd like to see it work with original Atari

>hardware, which is why I am currently trying to find a way for it to run
>on a 64K machine.

Whatever you do, make it modular and provide a modular, expandable API (Application Programming Interface)! That way, you can issue upgrades a module at a time, and ANY upgrade ANYTIME, ideally without requiring applications to be rewritten, recompiled, or relinked... Take VAX/VMS as your model... :-)

>be used for new software written for it (if any).

A recent (on this end, anyway) message suggested (and I agree) that this "new OS" should be FREE if it is to make any serious inroad into the Atari user community. That means that Michael Ellis, should he decide to proceed with this project, will be engaged in a "labor of love," doing the job with no thought of reward other than the knowledge of having done a Really Cool Thing. This may sound (especially to Michael!) discouraging, but on the other hand it relieves the programmer of any "pressure to succeed." Once he creates it, even if only one or two other people ever use it, well, it's still a Really Cool Thing and is now a part of history.

So, the question Michael now has to ask himself is, "am I willing to do this JUST because it'd be a Really Cool Thing to do?" Personally I hope he DOES.

I also perceive that a lot of ambitious projects that manage to get STARTED, still never get FINISHED. The programmer gradually gets busy with other things and spends less and less time on the project until finally he can't remember what he was working on or what he had in mind, and perhaps mothballs the Atari to make desk space for something else... Personally I hope that this does NOT happen to Michael, but he'll need to be vigilant against it.

I guess my advice to Michael would be, "DO IT. And do it NOW, while you're still excited about it and have a vision of what it could be, what it should be, because it will only last so long and it would be a pity to lose that moment of inspiration!"

Cough. Guess I waxed religious there for a second. Sheesh. Sorry about that, but I'm going to let it stand. I've acquired three new (to me) Atari 8-bit computers in the last two months and am starting to think I should hook 'em up to do useful household tasks and stuff like that. I'm about ready for SIO2PC, a Black Box, a Multiplexor perhaps, and so forth! What can I say; I'm in the mood for souped-up Ataris! :-)

Yeah, really! A guy on Bob Puff's BBS recently asked if anybody had done, or was working on, FAX software for the 8-bit! After my mind finished boggling and I could type again, I politely posted a reply in which I gave him chapter and verse about the incredible resource requirements of such a program as compared to the resources available on the platform. I have yet to receive a reply...

I'm ashamed to admit that I'm so out of touch that I am not familiar
with this "Xmission." Could somebody give me the complete FTP address,
and directory spec, please? <blush>

I've also noticed that (as you all know) Umich is just about impossible
to get into at ANY hour of day or night. I've tried the mirror sites
listed when Umich refuses me, but could only 'open' ONE of them, which
then ALSO refused me ("too busy" itself). The other sites listed, didn't
even seem to EXIST, or at least Portal didn't recognize them! Who's
in charge of the Umich archive, and have they verified the information
in their refusal message lately?

So, the major reason for changing graphics chips would be to
add support for 80 columns? If so, why hasn't there been more support for
the XEP-80?

>I bought one of the very first LE Systems (Leading Edge at the time) floppy

>sing something, but if so, I don't know what it is and you should now en-
>lighten me!

There is no way that compiler generated code can even _approach_ the speed
of good Assembly language. Size is an even wider disparity. This is an
old argument, and my apologies to those that didn't want it dragged out
again. Michael's point is very valid -- at least in an optimal world. This
of course, is not the type of world we live in, and thus C definitely has
it's place. Primarily due to the huge advantage of being able to port code
from one machine to another. If there were a more complete C implementation,
(especially for the 65816 with expanded memory), there would be a lot of
code available for our machine that realistically isn't going to be
written otherwise because of the time investment in writing it from scratch.
Given the choice between having code that is too big and too slow, and not
having the code at all, in most cases it's better to have the former.

>"GED"? What's that? Oh, yeah, John Harris talked about that, what, a year
>or more ago now? Jeez, I've GOT to start keeping in better touch here.

Granted, the version of GED that was uploaded did not have many drawing
features, but it did work. I used it mostly for coloring graphics created
or converted with another program. The format can be extended to provide
even more graphics power, and I still plan to do this. I can also get 25%
more colors out of a 65816 version.

John Harris - jharris@cup.portal.com

P.S. Some have noticed that I have started posted more often again. This
is partly due to finally getting out from under the disasterous mess of
having my business partner pass away last year, as well as other problems.
Even more so, I am preparing myself for a time in the very near future when
I am actually going to get a local access to the net. For the first time
ever, I won't have to call long-distance to login, and I hope this will
have a positive effect on my on-line presence as well.

There will be a change in my EMail address very shortly, (though I'll keep
this account for a little while longer), and I'll post it here when it's
ready.

>along WITH the GUI!

If it were written in C, you would probably be correct. Otherwise, 32K
should be plenty. (Most of that in bank select RAM, hopefully). I'm
not counting data for lots of different font sets in with that estimate.

Full customizability takes very little added space, if it's designed and
integrated well at the very beginning. It's retrofitting stuff like
this that can become a size problem.

From: potter@escmail.orl.mmc.com
Message-ID: <3vb5lu$b0q@theopolis.orl.mmc.com>
Source record: 89508

Okay, I've tried ColrView with GR.10. It has to change seven color registers each line in the DLI. The old 6502 isn't quite up to it, and color banding appears on the left side of the screen. One or two registers aren't updated in time for the electron beam, and the effect lasts about 1/4th of each raster line. But the blacks are nice and pure. And seven colors + black yields 7 x 7 x 7 + 1 or 344 colors.

A long while back I dreamed up a "chroma killer" circuit change. It would detect when the luma output is all zeroes, then gate out the chroma signal before it gets combined with the luma. This would also fix the blue/purple haze y'all are complaining about.

Also take a look at Clay Halliwell's program that views CV pics and uses the players to black out pixels that are a luminance of zero. I forget the name right now...

Bill,

I like that idea! If I had a 64K machine, I could run the new
OS, and then run some smaller programs on top of it. If I upgrade, I can
run bigger programs under the OS.
Still, I want it to run my old software, too....

Source record: 89512

My setup is:

For games: 48k 800 w/ 1050 disk drive, joysticks, paddle controller and trakball and a 25" Magnavox TV.

For real: 320k 130XE w/ xf551, Happy 1050, Super Archiver 1050, Canon BJ 200 printer, LineLink 14.4 kbaud modem, P:R: Connection (also an 850 I/F), Amdek Color I monitor, Sakata SA-1000 amber screen monitor for Ice-T, mainly. I also have a bunch of backup hardware, just in case.

I run TopDos Pro for everything I can 'cause it works so well with a variety of different floppy and ram disks and allows convenient command file reconfiguration for differing LOMEM program requirements.

I think saying that the 6502 is not well suited to multitasking is a bit of an understatement ;-). Nevertheless, there are ways to accomplish this. Consider memory managment. It's really not well suited to addressing more than 64K, but I can convince compliant software that there is 192K of linear RAM in a high-RAM 8-bit machine. The secret lies in how many levels of abstraction you are willing to deal with.

> And by the way, for extended filenames you could copy DOS and use
> filenotes (CTH filenotes) to store them.

I had considered use a similar approach. The primary disadvatage is that frequent table look-ups can be time consuming. It's a viable option though.

In my Atari, at least, the OS is built into ROM. This means that loading
the old OS consists of putting a disk with DOS in the drive and loading it
(or switching your boot paritition on your HD). Furthermore, almost ALL
of my old 8-bit software has no QUIT option. This means that you have to
reboot after using each program. Considering that the old OS does not
offer the ability to switch between one program at a time much less
several executing at the same time, I don't think it's too much to ask
that the new OS be allowed to dominate the system for its session.

But, hey, that's me.

: cc8 programs can directly use expanded memory without any fuss. This
: would initially involve implementing a 24-bit (?) "virtual" address
: space which the virtual machine would decode into banked RAM.
: - a real malloc() for cc8 (the one published in atari classics can only
: allocate page 6 memory)

One of the great "what ifs" of the Atari8 was banked RAM. I'm sorry, but
1 meg XEs being used for ramdisks are a fucking waste (excuse my language).

Basic XE is the only language out there that shows you what this banked
ram SHOULD have been used for, i.e. LARGER programs without any manual
bank twiddling.

And those of you out there who raise the banner of modularity. That's
fine. But what we've got here is a pretty cramped memory space. Part of
it is taken up by OS overhead, and part by the screenmemory, and whatever
language you may be using, and the DOS. When all is said and done, your
1 meg XE has only 30K or so available for mainline code, and that's
really lacking for a lot of things. When writing BBS software you have
the resident ML core bumping up MEMLO such that you wind up with mondo
modularity. BBS EXPRESS PRO! is really a throwback to old mainframes
with drum memory in the way it swaps overlays back and forth in really
tiny chunks. It's a kludge that really didn't have to be there if people
didn't just write for the LCD and pushed the banking boundaries. Forem
XEP, on the other hand, does most everything all on its main 128K program
and as a result the user doesn't have to wait as long for module
switching (and even ramdisk access is slow IMO on the Atari). Carina is
also a module mess.

I was hoping that FTE would rewrite BXE to be able to access larger
upgrades. I don't know how BXE was set up to know how difficult that
might be, but this would have been nice.

TurboBasic "XE" would be just as nice.

The Atari8 is just plaing cramped. 64K limits are a problem! Don't fool
yourself. Look at what SpartaDOS X does to get around this. Banks (rom
and ram) are the only way to enhance the Atari8. 64K is fine for the
type of OS that the Atari has, but if you want something more elaborate,
you have to bank out or go 16-bit. The CoCo does this by necessity.

If you are going to bother spending countless hours slaving on a new OS,
don't just spice up the single tasking existing OS/DOS and ignore all the

OS developments which have come since. Worry about new software support LATER. If it isn't a big improvement it won't be much of an acheivement. If it's really good and sees little development, at least the few apps tha DO exist will speak well for the Atari8 and may create a domino effect of support. Like I said before. The original CoCo OS was _NOT_ OS/9. That was an option and quickly became the standard for the discriminating user.

1628. OS stuff - in case it didn't get through

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-28 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <199507280823.BAA03887@zippy.sonoma.edu>
Source record: 89519

Original Subject: Re: Interested in NEW ATARI 8-bit OS?
References: <michael-1907952034380001@dialup-c3.cis.ufl.edu> <RvKAxcR.ransom22@delphi.com> <199507240243.TAA20224@zippy.sonoma.edu> <142774@cup.portal.com>

Chris, yes I realize how horribly large a GUI for the 8bit would be, let alone one that is very user redefineable (HEY, I didn't say the WHOLE GUI system would sit in memory at the same time! Look at M:ultimouse.

You load the version of M:ultimouse you need: joystick, trakball, ST mouse, etc. The PROGRAMS which access it do not need to support all of the different input devices there are (AHEM: and ever WILL be). Same with R: handlers. This is beautiful, to me.. that a relatively new peice of hardware like a Black Box can still be used by ancient terminal software.

If I want my windows to be drawn in a certain, very different way than they are drawn now, I simply relace the "draw-window" routine with a new one. Get it?

And your idea about emulators taking advantage of their machine's resources is a cool one- I thought of it too.. 320x200x256 mode, eh? :) It's possible.. but "You need an ATARI XF (Xformer) to run this program" :) That'd get annoying .. unless of course the way it's accessed is in a AHEM: modular way. :) Perhaps for that ONE DAY when REAL Atari's (XLs/XEs) get 320x200x256 support.. then the programs that used to only run on Xformer because they accessed 256 colors would work- as long as you had some hardware upgrade. :)

Modularity is the word flashing in my head every time I read this thread. ;) I think it's DEFINITELY worth it - hell, even though it's on a little 1.79Mhz (6502/>>65816<< :)) Atari XL, it'll still be a nicer environment than Windows 3.1 on a 100Mhz 586 :) Esp. since you can still play Star Raiders ;)

1629. How do you get the Atari to call home?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-28 00:00:00 UTC
From: rhino@aztec.asu.edu
Message-ID: <3vb4fr$cnf@news.asu.edu>
Source record: 89520

I am trying to create a program for an Atari. However, I don't know which commands to use in order to get the modem to dial a number. I am using BASIC and I was wondering, if there was anyone who could help. I really appreciate your help. Have a nice day! :) Oh yes, one more thing, Never mind.

1630. ULTIMATE VIDEOGAME AUCTION DAY 6

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-28 00:00:00 UTC
From: jrm8248@u.cc.utah.edu
Message-ID: <3v9kq4$ggs@news.cc.utah.edu>
Source record: 89637

I have been trying clean out my closets and I have decided to have an auction.

HERE ARE THE RULES:

1. This auction is from Friday, July 21 until Friday, July 28 at midnight
mountain time.

2. Current high bids will be posted daily on this newsgroup.

3. High bidders will be posted by their email name unless otherwise specified.

4. When sending a bid, your subject must be AUCTION BID .

5. Minimum bids will be $1 unless otherwise posted and bidding increments will
be $.50 all in US Dollars.

6. If two people bid identical bids, then the person responding first will get
credit for the bid.

7. Shipping will be $2.00 for the first cartridge + $.35 for each additional
cartridge. All cartridges will be shipped through the US Postal System anywhere
in the Continental US. Other areas will need to make special arrangements for
shipping.

8. On Saturday, July 29 I will post the final bids and each bidder will be
contacted individually for payment and shipping. Money Orders (sorry no personal checks) are the preferred form of payment, but cash is always accepted.
Payment MUST be received within 7 days.

9. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST PAY FOR YOUR ITEMS, OTHERWISE
YOUR POSTMASTER WILL BE INFORMED AND YOU WILL BE BARRED FROM FUTURE AUCTIONS!!!

ATARI 2600-NEAR MINT W/BOX & DIRECTIONS

-Adventure $3.00 William

-Berserk $3.00 lestermi

-Chopper Command $3.00 Mike

-Combat $3.00 min

-Freeway $3.00 min

-Laser Blast $3.00 min

-Maze Craze $3.00 William

-Missle Command $3.00 min

-Pac Man w/ Atari Pac Man Sticker on Box $3.00 min

-Skiing $3.00 William

-Space War $3.00 min

-Star Master $3.00 min

-Star Raiders w/touchpad and atari hologram on box $4.50 lestermi

-Surround $3.00 Dougman

-Video Chess: Special Edition $3.00 William

Atari 2600-LOOSE GAMES

-Atlantis: Imagic
has a number written faintly on one side

-Air-Sea-Battle: Atari

-Blueprint: CBS Electronics $2.50 grogg

-Pole Position: Atari $2.00 min

-Protector: Atari $2.50 MichaelG

-Star Trek Strategic Operations Simulator $3.00 GaryB

-Terminal Emulator II $4.50 Rob

-TI Extended Basic $3.50 MattR

-TI Invaders $1.00 MattR

-Tombstone City $1.00 MattR

MISC. SYSTEMS-
*some systems say no cables but if you bid I will look for them, but
I will
not guarantee that I find them. Shipping will vary depending on the system.
MINIMUM BID INCREMENTS FOR ALL OF THE SYSTEMS WILL BE $1

-Atari 2600 $10.00 EricB

-Atari 600XL no cables $6.00 sam

-Atari 800XL no cables $15.00 yee2

-Atari 810 Disk Drive, no cables $12.00 Rob

-Coleco Adam Computer, some cables $10.00 BradE

-Intellivision II w/ Atari System Changer $35.00 rjdawson

-Odyssey2 in box with cables $10.00 Shawn

-Texas Instruments 99/4A w/box + manuals & cables $11.00 Marlin

-Unisonic Olympian $9.00 Russ

If you are interested, I have an excess of certain games which I will sell for
$1 + shipping each. Currently these are:

ATARI 2600-excess

-Pac-Man
-Combat
-Asteroids
-Defender
-Missle Command
-Space Invaders

Send all bids to: james.manazer@m.cc.utah.edu

>then ALSO refused me ("too busy" itself). The other sites listed, didn't
>even seem to EXIST, or at least Portal didn't recognize them! Who's
>in charge of the Umich archive, and have they verified the information
>in their refusal message lately?

Our 8-bit contact there has been Jody Lenn, at lenn@atari.archive.umich.edu.

Here's my list of Merit/UMich mirrors from the FAQ:

a) ftp://atari.archive.umich.edu/atari/8bit (141.211.120.11, United States)

b) ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit
(128.252.135.4, United States)

c) ftp://src.doc.ic.ac.uk/computing/systems/atari/umich/8bit
(146.169.2.10, United Kingdom)
d)
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit
(129.69.8.13, Germany)

e) ftp://ftp.orst.edu/pub/mirrors/archive.umich.edu/atari/8bit
(128.193.4.2, United States)

f) ftp://barnone.citi.umich.edu/afs/umich.edu/group/itd/archive/atari/8bit
(141.211.128.22, United States)

g) ftp://phlem.ph.kcl.ac.uk/pub/Atari8bit (137.73.4.24, United Kingdom)

h) ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
(147.70.146.36, United States)

Admittedly, it's been a few months again since I verified them all myself,
but as of this past spring they were all there. I recommend the "barnone"
site, that's where I go all the time.

If you use Gopher, try these:

gopher://gopher.archive.merit.edu:7055/11/atari/8bit

gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit

gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit

gopher://gaia.ucs.orst.edu:70/11/g-i-s/computer/zftparea/mirrors/archive.umich.edu/atari/8bit

If you're limited to mail, try this example. Send a message to bitftp@pucc.princeton.edu that says exactly:

```
ftp barnone.citi.umich.edu
user anonymous
cd /afs/umich.edu/group/itd/archive/atari/8bit
dir
cd Telecomm
dir
get ft80v037.txt
get icet.txt
binary
get ft80v037.arc
get icet.arc
quit
```

Accessing the Merit/Umich archive should not be a problem for anyone.

1633. 800XL DJ for falcon

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-28 00:00:00 UTC
From: bleroy@ccr.jussieu.fr
Message-ID: <3vah3f$qgt@vishnu.jussieu.fr>
Source record: 89640

Hi there!

Has anybody tried to do the cable described in the 800XL DJ files to connect a 8bit to an atari falcon?
I've tried it, but it doesn't work. The falcon still works fine. When I plug the cable, though, the 130XE doesn't detect the falcon as a drive, nor is it able to control properly its 1050 drive. When I unplug the cable, the 130XE works fine, as before.
If you have successfully or unsuccessfully done this cable, please e-mail me...

Thank you for your help.
Bertrand

>I loaded it with the standard RVerter R: handler (like for SX212's).

>Does it depend on the cable - was I using a wrong handler - did I have
>some FT80 options messed up for that config?

What I did was use an RS-232 switch box to select either modem or PC from the SIO2PC cable. I used a cable that came with the modem, but it should be a standard modem cable. The only terminal program I have used is BobTerm, and I used the R: handler that comes with it.

Message-ID: <DCFFC4.9xJ@aston.ac.uk>
Source record: 89643

```
----------------------------------------------------------------

Rainbow - An Atari 400/800/800XL Emulator for the Apple Macintosh

----------------------------------------------------------------

Welcome to the world of Rainbow! Now you can run many of your
favourite Atari 8 bit software on your Mac. And if you're a
lucky PowerMac user you will get great emulation speed from
Rainbow. Cool features in the full shareware version include...
```

• Emulates 400/800 and 800XL machines

• Has 48K RAM for 400/800 machines; full 64K RAM for 800XL

• Accepts 8K and 16K cartridges; also runs Super Cartridges

• True 256 Atari colours

• Full ANTIC/GTIA character and graphic modes

• Player/Missile Graphics with full collision detection

• Display List Interrupts

• Fine scrolling

• Two virtual disk drives capable of reading single and
enhanced density images

• Transfer files between disk images and your Mac hard disk

• Sound with 4 channels of pure tones and improvised noise

• Four joysticks (via keypad) and four paddles (using mouse)

• Plays many games like PacMan, Defender, Joust, Qix,
Eastern Front, Zaxxon, M.U.L.E., Montezuma's Revenge,
Donkey Kong, Miner 2049er, Necromancer, Karateka, Drol,
Kaboom, Gauntlet, Pole Position II, World Karate,
Hardball, Spelunker and, of course, Star Raiders.

```
You can obtain a demo version of Rainbow at the WWW site

http://www.aston.ac.uk/~lamcw/emulators.html

or by FTP from InfoMac

rainbow.sit.hqx at ftp.amug.org
```

(I only sent this a few minutes ago to InfoMac... I asked them
to put it in 'games')

Recommended set-up is a PowerMac or '040 CPU running System 7
or later with a colour monitor. Both Powermac native and 680x0
versions are included.

Please note that the Atari OS ROM images are NOT included.

Full details on how to transfer these ROMs and other files from
your Atari system to the Mac are provided. An 850 Interface Module
is required and you will need to make a simple cable.

The full shareware version is available for 15 UK Pounds
(about 23 US$). See demo for registration details.

E-mail me, Chris Lam, at lamcw@aston.ac.uk.

Bye for now!

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <142809@cup.portal.com>
Source record: 89648

Well Glenn, I was trying to stay away from this but some of your comments
should be addressed. It may be obvious that I like small systems but
just as a point of order, how big of programs have people developed
anyway? I know I've been programming in one form or another for years & I've
only done something like 3 or 4 programs that were greater then 16k.
Another sign of code vs bloat is SD, the entire package was distributed
one one single density disk/version! OK, now there are the bbs programs,
but how many are there? Maybe less then 8 viable packages in 15 years &
a lot of the room they need is for data rather then actual code. Hobbiest
users in general do not make large programs. The examples you gave of things
like a fax program or compression routine were valid, but that & maybe
a few other applications like MODs or digitized speach are the only areas
where memory contraints are a problem & once again, it's data not
code.
As far as some of the other things relating to multitasking, if people
were willing to accept a common runtime package it would be doable, but
good luck! For instance, in a normal envirionment you would have somebody
write a program in C, somebody else in Pascal, ... Now each of these
programs would have their respective runtime packages resident in memory
at the same time. IMO, this is convienient for the programmers but not
good for a system with 16k banks. Just by way of example though, let's
say Kendrick asked me for a module for a program he was writing in Action!
The only thing he'd have to tell me or provide to me is the runtime
package he was using & where he's set the program counter. I could then
write code that would go into a bank, ANY BANK, and would access the
run time pack he's already loaded. I wouldn't even have to progam
in Action!, MAC/65 would work just as well. Matter of fact, if I ever
did get back into MAC, I'd probably just use the Action! run time pack
as my library anyway. Labor of love, but it took me, and Bill for that
matter, quite an investment in time to learn Action!. In my case, I started
off programming in assembly before basic even so I'm a little more
comfortable with both Action! & assembly. I expect no one at this stage
of the game to make the same investment in time and money, but it
could be almost that simple. I could tell an begining ML programmer
the requirements for accessing the Action! runtime package & I doubt
if the dumbest guy in the group wouldn't have it figured out in an
hour. 16k of space is plenty if you've got 4k of subroutines at $2400 or
so that do everything from string comparisons to block moves.
Rick

Chris, James King will probably give you the full FTP address. But how would people feel about trying another public site that doesn't seem to get much use? I'm not sure they would let us, but recently I've FTP'd to oakland.edu & 1) It had less then 1/2 the available lines taken 2) It already has an Atari area, only about 4 files though. Doesn't cost anything to ask if they'd let us maintain an archive there.
Rick

1643. New URL for Atari 8-Bit Homepage!

Newsgroup: comp.sys.atari.8bit

From: ipoorten@cs.vu.nl
Message-ID: <DCFGn4.7LJ.0.-s@cs.vu.nl>
Source record: 89650

Hello!

My Atari 8-Bit Homepage has been moved to a new machine. This new machine is totally devoted to WWW and nothing else (unlike the old machine which also did nntp and some other stuff). The new URL is:

http://pmwww.cs.vu.nl/home/ipoorten/Atari.8bit.Homepage/index.html

If you have any links to the old URL, please change them into the new one. Also, if you encounter any problems while retrieving pages from the new machine, for examples, if pages can't be found or can't be accessed, report them to ipoorten@cs.vu.nl so I can fix it.

Bye,
Ivo

1644. NEW: PC Xformer 3.2 130XE emulator

Newsgroup: comp.sys.atari.8bit

```
PC Xformer 3.2 Atari 130XE Emulator for MS-DOS
==============================================
July 28, 1995

Price: $34.95 U.S. ($29.95 until August 31)
Available: immediately
Requires: any MS-DOS compatible 486 or Pentium based PC

For additional product information contact Darek Mihocka at:

Branch Always Software
14150 N.E. 20th Street, Suite 302
Bellevue, WA 98007, U.S.A.

Phone: 206-236-0540
Fax: 206-236-0257
America Online: BRASOFT
Compuserve: 73657,2714
GEnie: BRASOFT
MSN: BRASOFT
Internet: brasoft@halcyon.com
World Wide Web: http://www.halcyon.com/brasoft/

Introducing PC Xformer 3.2, the newest and fastest Atari 130XE which
allows any 486 or Pentium based PC to run Atari 800, Atari 800XL, and
Atari 130XE software as fast or faster than a real 130XE. PC Xformer 3.2
is fully backward compatible with earlier versions of PC Xformer and ST
Xformer and supports disk files created by the SIO2PC cable, ST Xformer,
and PC Xformer.

The three biggest features in version 3.2 are SPEED, SPEED, SPEED!
Unlike earlier versions of PC Xformer which were optimized for use on
386 based computers, PC Xformer 3.2 has been optimized for the 486 and
Pentium and runs an average of about 40% faster than the earlier
versions.

What this means for users is that PC Xformer 3.2 now runs about 9 times
faster than a 130XE (equivalent to a 16 MHz 6502) on a 90 Mhz Pentium,
and about 5 times faster on a 486/66. Even the slowest 486SX based PC
now runs PC Xformer faster than a real 130XE giving faster smoother
graphics in games and faster Atari BASIC programs, without having to
upgrade your PC.

For compatibility with programs that run best at the normal 1.8 MHz
speed of the Atari, PC Xformer 3.2 has two speeds of operation: NORMAL
(1.8 MHz mode) and TURBO (as fast as possible mode). All of the options,
such as selecting normal or turbo speed, whether to run with Atari
```

BASIC, whether to run in Atari 800 or XL/XE mode, etc. can all be set from the MS-DOS command line.

By popular demand PC Xformer now has a built-in 6502 debugger which allows you to examine and modify the Atari memory, disassemble 6502 code, and even single step 6502 code. For die hard hackers PC Xformer 3.2 also supports the ability to customize the Atari OS and BASIC.

PC Xformer 3.2 has full support for emulating Player Missile Graphics with collision detection, GTIA graphics modes, ANTIC display lists and DLIs, 256 color support, joystick support (as well as joystick emulation via the cursor keys on the keyboard), sound, printer, modem, and more. Atari BASIC as well as the Atari 800 and XL/XE operating systems are built-in.

PC Xformer 3.2 can also be run from the MS-DOS prompt in Windows 3.1, Windows 95, OS/2 2.1, and OS/2 Warp. Run it directly from MS-DOS for fastest speed.

PC Xformer 3.2 also includes a 40 manual, a copy of the shareware SIO2PC software, and about a megabyte of sample Atari 8-bit software.

How to order

Brand new users can purchase PC Xformer 3.2 by contacting Branch Always Software directly. To order by VISA or MasterCard, call us at 206-236-0540 and have your card ready, or send your order in by mail.

During the month of August we are offering PC Xformer 3.2 at an introductory price of only $29.95. After August 31 the price is $34.95.

Registered users of PC Xformer can upgrade for only $15. All prices include shipping to anywhere in the world.

PC Xformer 3.2 will also be available by September 1 from major Atari dealers including American Technavisions, B & C Computervisions, and Toad Computers. Call your local Atari dealer for pricing and availability.

Add-on products

There are several products and services available from other Atari developers which are of benefit to PC Xformer users.

The SIO2PC cable is a cable which connects your PC to your Atari 8-bit computer and allows you to transfer over entire disks of Atari 8-bit software to your PC. SIO2PC works on any MS-DOS based PC and creates "disk image" files which PC Xformer uses. SIO2PC can also be used to transfer files from the PC back to your Atari 8-bit computer.

SIO2PC is available fully assembled or in kit form from:

Nick Kennedy
300 South Vancouver Street
Russellville, AR
72801

Users who do not have access to an Atari 8-bit computer or an SIO2PC cable can have their disks transfered from Atari 8-bit 5.25" floppy disks to IBM PC 3.5"floppy disks for a small fee by contacting Rob Satonica at:

Creative Software Systems
7775 Scottdale Rd.
Berrien Springs, MI 49103

phone: (616) 473-3904

Also available from Creative Software Systems is the Atari Emulator Manager, an inexpensive MS-DOS utility which allows you to manage your Atari 8-bit files, configure your PC Xformer settings, and run PC Xformer, all by using your mouse to click on the various options and files on the screen. A must have for any PC Xformer user who juggles a lot of different Atari files! For example, you can have one configuration that runs your Atari BASIC software in turbo speed Atari 130XE mode. You could then have another configuration that runs your games disks in normal speed Atari 800 mode. Do all this by just pointing and clicking with the mouse.

To order or to find out more about the Atari Emulator Manager, contact Rob Satonica at Create Software Systems.

Atari shows

Once again we are hitting the road to demonstrate our products at Atari shows around North America. If you missed us at the Toronto and Sacramento shows in April, you can drop by our booths at the Indianapolis Atarifest on July 29th and the Dallas Atari show on October 7.

At both shows we will be demonstrating and selling the PC Xformer 3.2 emulator as well as our new Gemulator 4.0 Atari STE emulator for Windows 95.

If you cannot attend the shows, send us your name and address to receive future product announcements, show dates, our authorized Atari dealer list, product order forms, and more. If you are on the Internet, drop by our Web page.

Benchmarks

Ok, just how fast is PC Xformer? We belive it to be the fastest 6502 emulator available for your 486 or Pentium. We put a real 130XE computer side-by-side with a 486/66 computer and a Pentium P5-90 computer then ran some benchmarks in Atari BASIC. We found the 486/66 runs at least 4

times faster than the 130XE, while the 90 MHz Pentium runs at least 8
times faster, and sometimes faster!

Benchmark #1 is a simple FOR NEXT loop:

```
10 FOR X = 1 TO 10000:NEXT X
```

Atari 130XE: 22.5 seconds
66 Mhz 486: 4.6 seconds (5 times faster)
Pentium/90: 2.4 seconds (9 times faster)

Benchmark #2 is a screen scrolling benchmark:

```
10 FOR X = 1 TO 10000
20 ?X;
30 NEXT X
```

Atari 130XE: 109 seconds
66 Mhz 486: 29 seconds (4 times faster)
Pentium/90: 14 seconds (8 times faster)

And finally, Benchmark #3 is a graphical line sweep:

```
10 GRAPHICS 8
20 COLOR 1
30 FOR X = 0 TO 319
40 PLOT X,0
50 DRAWTO 159,159
60 NEXT X
```

Atari 130XE: 32 seconds
66 Mhz 486: 8 seconds (4 times faster)
Pentium/90: 4 seconds (8 times faster)

Now you can understand why for games we needed to supply a normal speed
option!

Source record: 89652

James - yes, Action! IS nice... but it's not nice enough, IMO. Unfortunately I'm stuck with it. I know I'm going to get flamed on this one, but I actually think TurboBASIC XL is a more powerful language when it comes to the number of built-in routines and memory allocation handling it has..

Fast graphics routines, including a smart (recursive) fill routine, fast blit-drawn text (in any mode at any pixel position), etc.

And hell, it's compatible with good ol' Atari BASIC (and 5-10 times faster and can be pseudo-compiled, albeit a bit buggily)..

Ok, not that I'm saying TurboBASIC XL is the way to go - I haven't touched TBXL in a while.. it's as not fast, the programs aren't as self-contained as with Action!.. you need a special version to run with SpartaDOS 3.x and/or to use R: handlers (grrr). (Thanx to Tom Hunt for this, though!)

BUT - when I program MY kludge, it often ends up working more quickly (no unexpected crashes, I don't run out of memory all of a sudden, VERY trustable program-to-program switching, etc.) than Action! does.. <:^[

So what do I want? No, I don't want Action!BASIC XL :) ... I WOULD like a version of Action! which includes things like:

better structures (string in a struct, for example)
easy memory allocation
65816 code creation
65816 flat memory support
6502 extended memory support
operator overload (string = string + string)
built in things:
string types (so you need not declare them yourself)
float types (perhaps using a faster FP pkg than the OS has? :))
graphics routines
jump-to-dos, jump-to-program calls
free mem check from editor (like the [Sh][Ctl][?] hack is) (IF the environment is the editor/monitor/compiler mix that the current Action! cartridge is)
pmg routines
MACROS!!! (i can say "stick(0)" and it will NOT call the function.. it will simply act as if I defined something like BYTE STICK0=623 and then asked for STICK0 (direct mem access))
and on and on

It's very very possible, esp. with 65816's being around now! I'll help with the project - but sorry, only testing, support and design/ideas.. I'm not a very good coder, don't know 6502 and DON'T know 65816! :)

anyone else wanna start a thread (either here or e-mail) on this subject?

We had some good chat going on for those few months with the ADOS project
(btw- i think it's time to start that chat again :))

Ok. I agree that unix is not the greatest. I just use it every day. So
I'd like to have something on my 8-bit that feels like a unix shell and is
reasonably quick. I like bash and tcsh for the simple reason that they
allow command line editing with emacs keybindings and have nice filename
and command completion. I use 4DOS on my PC but it isn't as nice. I
haven't seen anything that beats a modern unix shell as a command shell, or
an editor that I prefer to any decent emacs (jed, NotGNU, GNU, or Xemacs
all come to mind). I think a shell with all of the features of bash that I
actually use and a small emacs-like editor are quite possible and would be
very useful on the 8-bit. I don't think anybody is clamoring for named
pipes and such on their 800...

James> Agreed. And many Unix-like utilities that have been mentioned,

James> I've gotten along well with A86 for the PC in this regard.

Hmmm... ok, for stuff with a single source tree in a single language. But
what if you want to write the front end to an assembly program in C, for
example? Most of the reason for make is that C compilers are never that
fast. I find make to be very convenient on other platforms.

James> As for high-level languages, I don't think it is possible to

I agree. If you want to do a really cool hack or if you want to write a
game on an 8-bit, you're going to be writing 6502 code. But, as John
Harris pointed out earlier, a decent C compiler would allow stuff for which
performance isn't critical to be ported from other platforms to the 8-bit.
I think this is a potentially good thing. I haven't used Action!.

James> I'm
James> glad that the authors of Alley Cat and Star Raiders and such

James> ahead with their projects.

Now you're being snide. :) And, as a tangent, Star Raiders wasn't developed on an 8-bit if I remember correctly. Atari used a VAX or PDP or somesuch for cross-development back then.

Brent

Agreed. And many Unix-like utilities that have been mentioned, like make, aren't great solutions to problems IMO. A better alternative to "make" would be to have a fast assembler so that assembling all the code is just as fast as running a make utility, selectively assembling code, and linking the result. I've gotten along well with A86 for the PC in this regard.

As for high-level languages, I don't think it is possible to out-do Action! on the 8-bit machines. If anyone could get a C compiler to be anywhere near as fast, both in compilation speed and executable speed, I would be amazed. I still think that assembly is the way to go; 6502 assembly is fun and easy. I'm glad that the authors of Alley Cat and Star Raiders and such weren't so upset at the lack of a C compiler that they didn't go ahead with their projects.

I don't think all those Gr10 screens will be necessary. In
fact it might not be at all practical, since poking new colors
into all eight color registers will most likely not be
possible to squeeze in before the border. That's why I asked
if it could be done just for the blue layer.

At least put in an option for either.

Gotta agree with you here, Glenn. In fact, I'll go so far as to list a few of the OS' important responsibilities:

1) Memory management - Figure out how much is available and where, and provide a linear allocation/deallocation scheme
for applications. Prevents memory fragmentation.

2) Task management - Allocates an appropriate amount of memory for the application and its data. Preemtively switches from
task to task as appropriate.

3) Resource management- Allows applications to use shared resources and prevents conflicts that can arise from this.

I think that if software is to be written for a machine, you really need an OS that provides at leas this much functionality. I don't think developers are going to be willing to continue to reinvent the wheel in terms of memory management and the like every time they write a new program.

-Michael Ellis

July 29, 1995

I'm selling all my Atari hardware, software, etc. that I've collected over the last 10 years to make room for the stuff I'm going to collect over the next 10 years! ;)
Here we go...

8-Bit:

1 130XE (w/128K RAM and custom power supply)
1 256K ICD MIO (w/XE adaptor, controller card, 20 meg HD & 40 meg HD)
1 Sanyo green/mono monitor
1 XF551 DS/DD 5 1/4" disk drive (w/manuals & DOS 2.5 diskette)
1 Atari 1025 Dot matrix printer
1 ICD R-Time 8 cartridge (1 year old battery)
1 Supra 2400 baud modem
All cables, power supplies, etc. necessary
1 Atari 1064 memory module (to upgrade a stock 600XL to 64K RAM)
300-400 various 5 1/4 floppies (God only knows what is on most of them anymore)
MIDI Mate module

8-Bit Software (All with original package and manuals):

BBS Express Professional (node #444)
CutthroatsWitness
Ballyhoo
Infidel
Suspended
Gauntlet
Hybrid Arts' MIDIPatch
Virtuoso Desktop Performance Studio
Sherlock 1050
Solar Star
Seven Cities of Gold
Realm of Impossibility
Pinball Construction Set
One On One
Movie Maker
Archon II: Adept
Lords of Conquest
Mail Order Monsters
D-Bug
Cut & Paste (EA's Word Processor)
Mercinary (w/Second City Disk)
Raster Blaster

The Halley Project
Buck Rogers (cart)
Airball (cart)
Archon (cart)
Barnyard Blaster (cart)
Battlezone (cart)
Crossbow (cart)
Dark Chambers (cart)
David's Midnight Magic (cart)
Desert Falcon (cart)
Food Fight (cart)
Thunderfox (cart)
Atari Word Processor (CX404 - For the old 800s)
Coversational Italian / Conv. Spanish (cass)
Atari Light Lab Module
Atariwriter 80
